

# Radiative transitions and the mixing parameters of the D meson

Monday, 2 October 2017 15:10 (170)

Spectroscopic parameters of heavy-light flavoured D meson are obtained within the framework of phenomenological quark-antiquark potential (Coulomb plus linear confinement) model using the Gaussian wave function. We incorporated  $\mathcal{O}(1/m)$  to the potential energy term and relativistic corrections to the kinetic energy term of the hamiltonian. We obtain the radiative (electric and magnetic) transitions and the mixing parameters of the  $D_q^0 - \bar{D}_q^0$  oscillation. The results are compared with various experimental measurement as well as other theoretical predictions.
