

A telescope for astroparticles with nuclear interactions above 10^{15} eV

Monday, 2 October 2017 15:10 (170)

A telescope for astroparticles with nuclear interactions above 10^{15} eV is proposed. Recent progress in the fiber-optic technique offers a real opportunity for a high-mountain detector to investigate singular nuclear interactions at energies $> 10^{15}$ eV. Given the telescope area of 1000 m^2 , the year exposition would give a few events at 10^{16} eV and a few hundred above 10^{15} eV. Event recording is supposed to be based on CCD sensors.

Primary author(s) : Prof. KOTELNIKOV, Konstantin (LPI); Prof. DALKAROV, Oleg (LPI)

Presenter(s) : Prof. DALKAROV, Oleg (LPI)

Session Classification : Poster session and coffee&reception
