

# **Nonlinear electrodynamics, regular black holes and wormholes**

*Monday, 2 October 2017 15:10 (170)*

A brief review of the existing regular models in general relativity coupled to nonlinear electrodynamics (NED). These include regular, purely magnetic black holes and soliton-like configurations with a regular center and dynamic wormholes with a magnetic source. It is shown that systems with an electric charge cannot form such regular configurations.
