

# Estimation of atmospheric neutrinos background in Borexino

*Tuesday, 6 October 2015 14:00 (15)*

Atmospheric neutrinos are produced in interactions of cosmic rays with atomic nuclei in the Earth's atmosphere. Although their flux is too low for studying in Borexino, atmospheric neutrinos act as a background for other processes. This talk presents the theoretical expected yield of atmospheric neutrinos in Borexino for three neutrino detection reactions:  $\nu\mu$ -ES,  $\nu e$ -ES and inverse  $\beta$ -decay, as well as the status of Monte-Carlo simulation for other interaction channels. Calculations were performed based on the only currently known detailed model of atmospheric neutrinos flux at very low energies.

## Presentation type

Section talk (10+5 min)

**Primary author(s) :** Mr. ATROSHCHENKO, Victor (NRC Kurchatov Institute)

**Presenter(s) :** Mr. ATROSHCHENKO, Victor (NRC Kurchatov Institute)

**Session Classification :** Nuclear physics and particle physics - parallel II

**Track Classification :** Nuclear physics and particle physics
