

# Measuring the neutrino mixing angle $\theta_{13}$ in reactor experiments

*Wednesday, 7 October 2015 13:00 (15)*

Neutrino mixing matrix elements were discovered one by one beginning from the solar neutrinos anomaly was found and neutrino oscillation hypothesis was proposed. At the moment all elements are known excluding several complex phases. Measuring of the last mixing element  $\theta_{13}$  was realized recently with three international experiments Double Chooz, RENO and Daya Bay. The highest accuracy was achieved in Daya Bay experiment. Now this result is used in accelerator experiments for looking for CP-violating phase  $\delta_{CP}$ .

## **Presentation type**

Plenary (25+5 min)

**Primary author(s)** : Dr. SINEV, Valery (Institute for Nuclear Research RAS)

**Presenter(s)** : Dr. SINEV, Valery (Institute for Nuclear Research RAS)

**Session Classification** : Nuclear physics and particle physics - parallel VI

**Track Classification** : Nuclear physics and particle physics
