

Data treatment system in the ALFA-ELECTRON space experiment onboard International space station

Saturday, 10 October 2015 09:30 (30)

The system of data collection, pre-processing and scientific information transfer on Earth from the onboard charged particle spectrometer is described. The system consists of high-speed units for converting of amplitude information into digital code, the logical block of information on the operation of the spectrometer, and a distributed system for collecting, processing and transferring information in the telemetry channels. The system has an additional channel of rapid processing and visualization of scientific information in the cosmonaut-researcher workplace. The basic functional units of the system, data collection and pre-processing of information algorithms, the creation of such systems on base of radiation-resistant elements are presented also.

Presentation type

Poster

Primary author(s) : Mr. BATISCHEV, Alexey (NRNU MEPhI)

Co-author(s) : Prof. GALPER, Arkadyi (NRNU MEPhI); Mr. NAUMOV, Pavel (MEPhI); Mr. NAUMOV, Peter (NRNU MEPhI)

Presenter(s) : Mr. BATISCHEV, Alexey (NRNU MEPhI)

Session Classification : Poster session V

Track Classification : Methods of experimental physics
