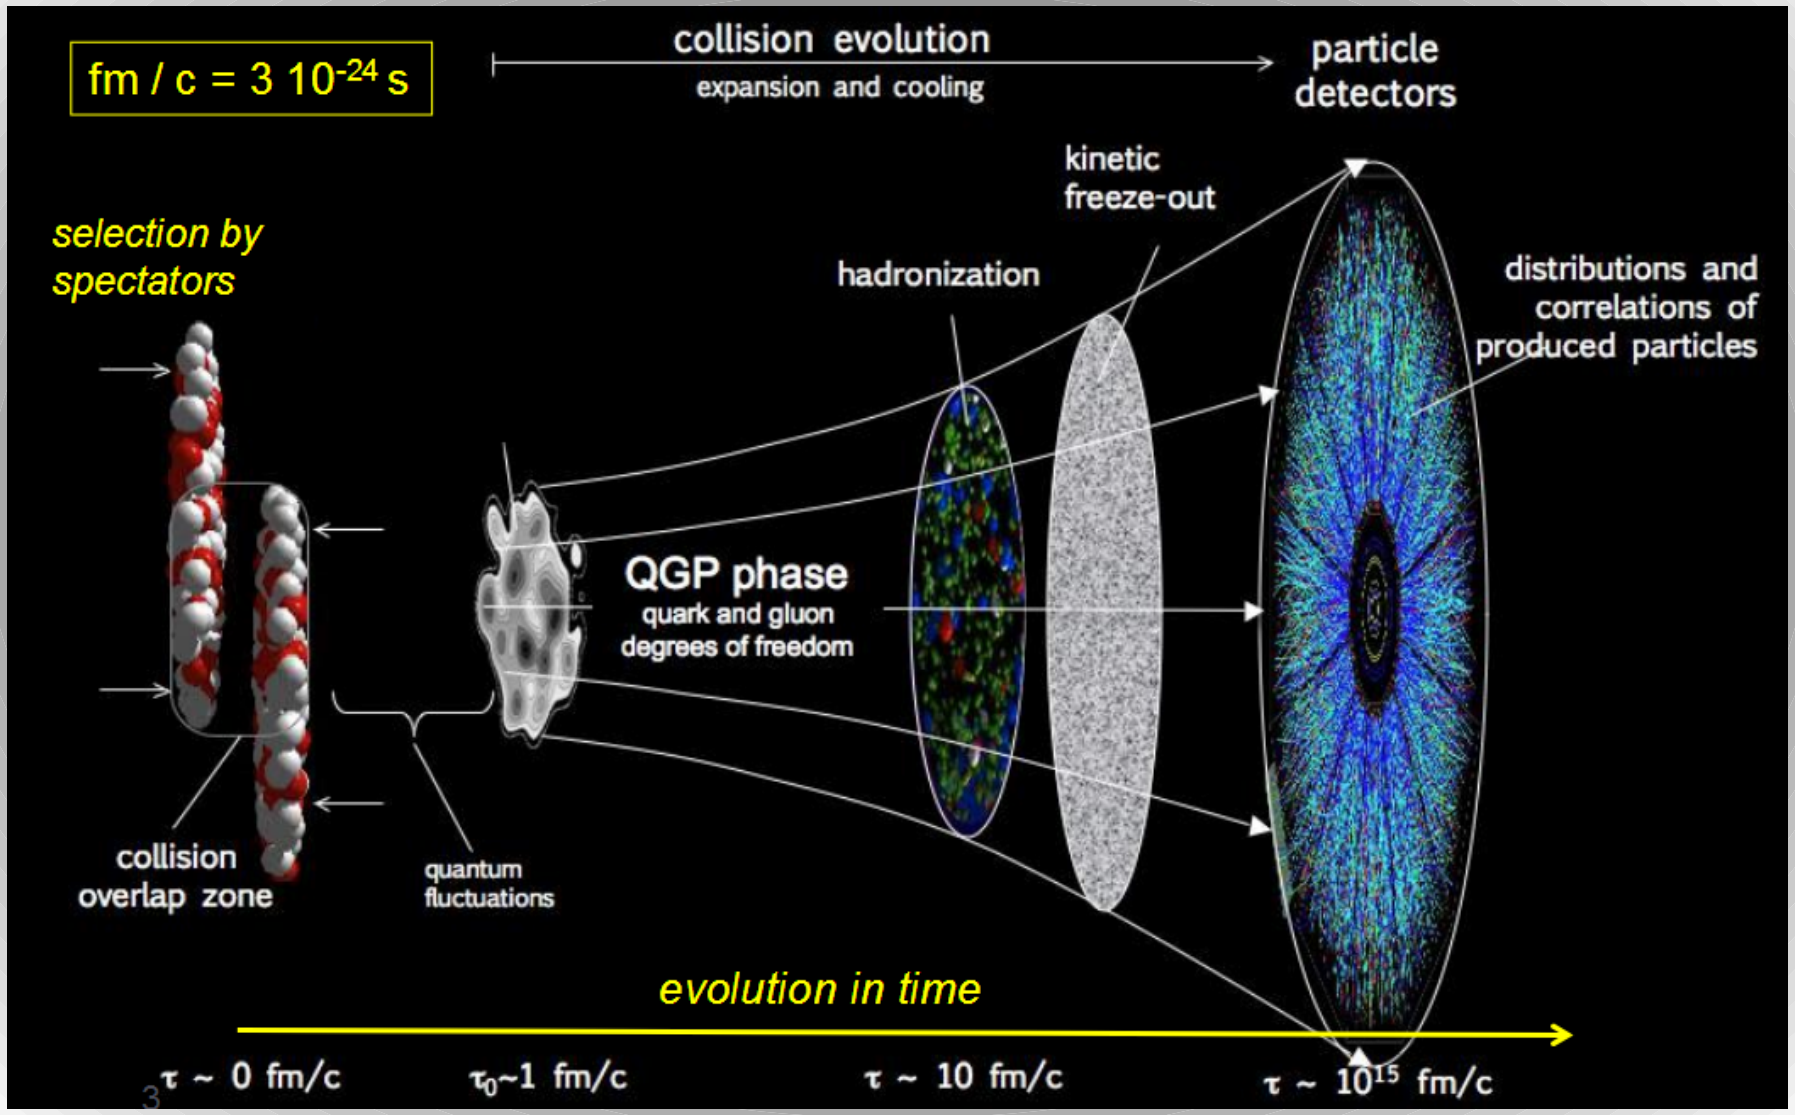
Plovdiv University
"Paisii Hilendarski"
Plovdiv, Bulgaria

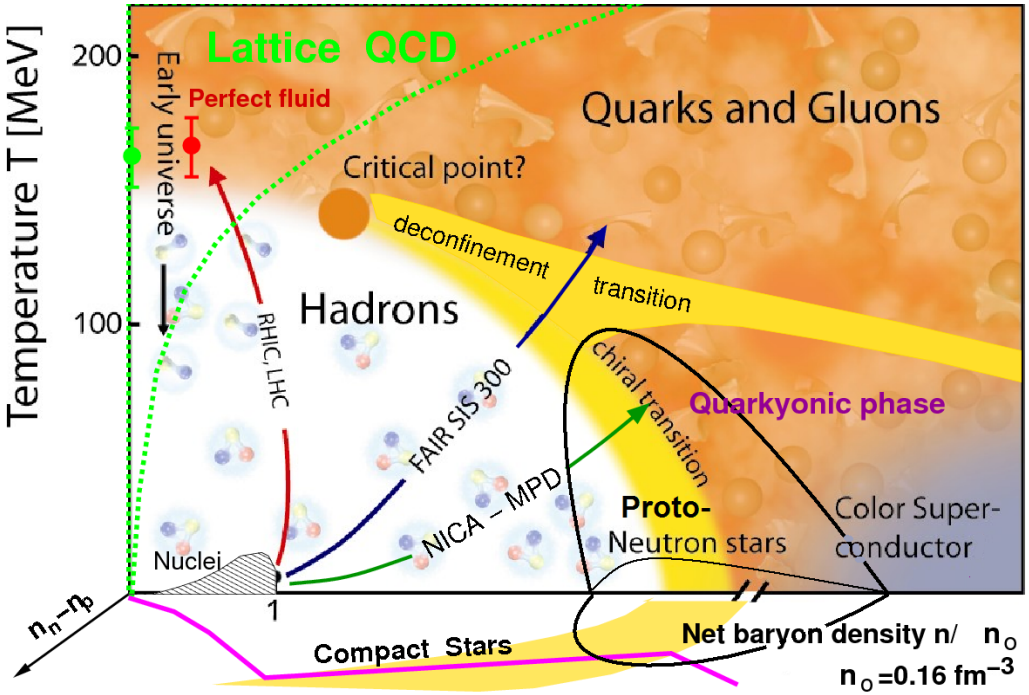
Outline

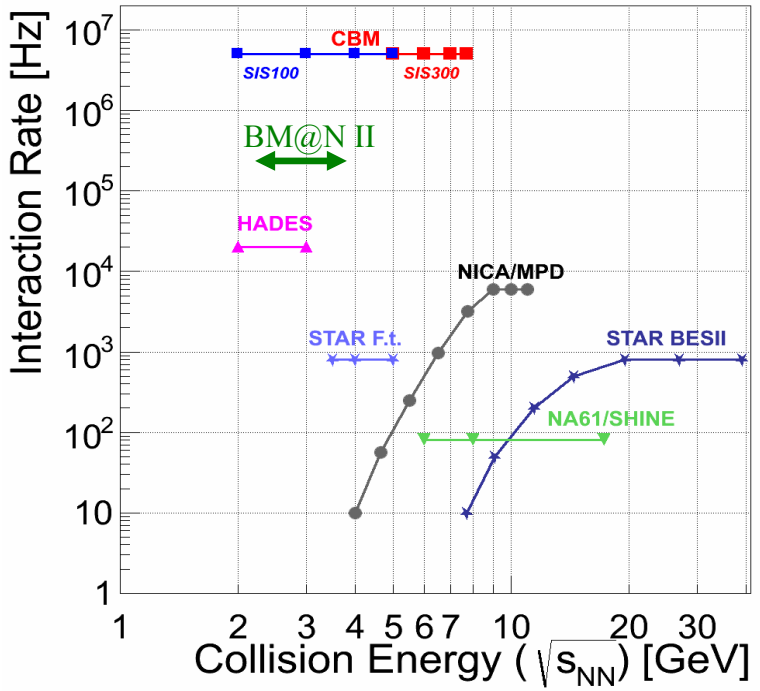
1. Introduction and Motivation
2. The Nuclotron-based Ion Collider Facility
3. The Multi-Purpose Detector
4. MPD sub-detector systems
5. Physics Feasibility studies
6. A call for collaboration
7. Summary

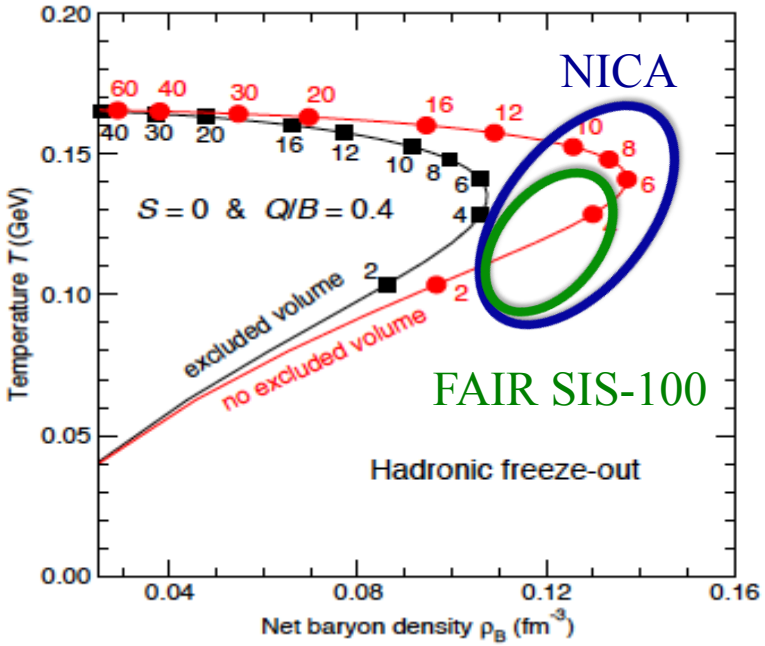
Relativistic Heavy-Ion Collisions & Quark-Gluon Plasma



Motivation





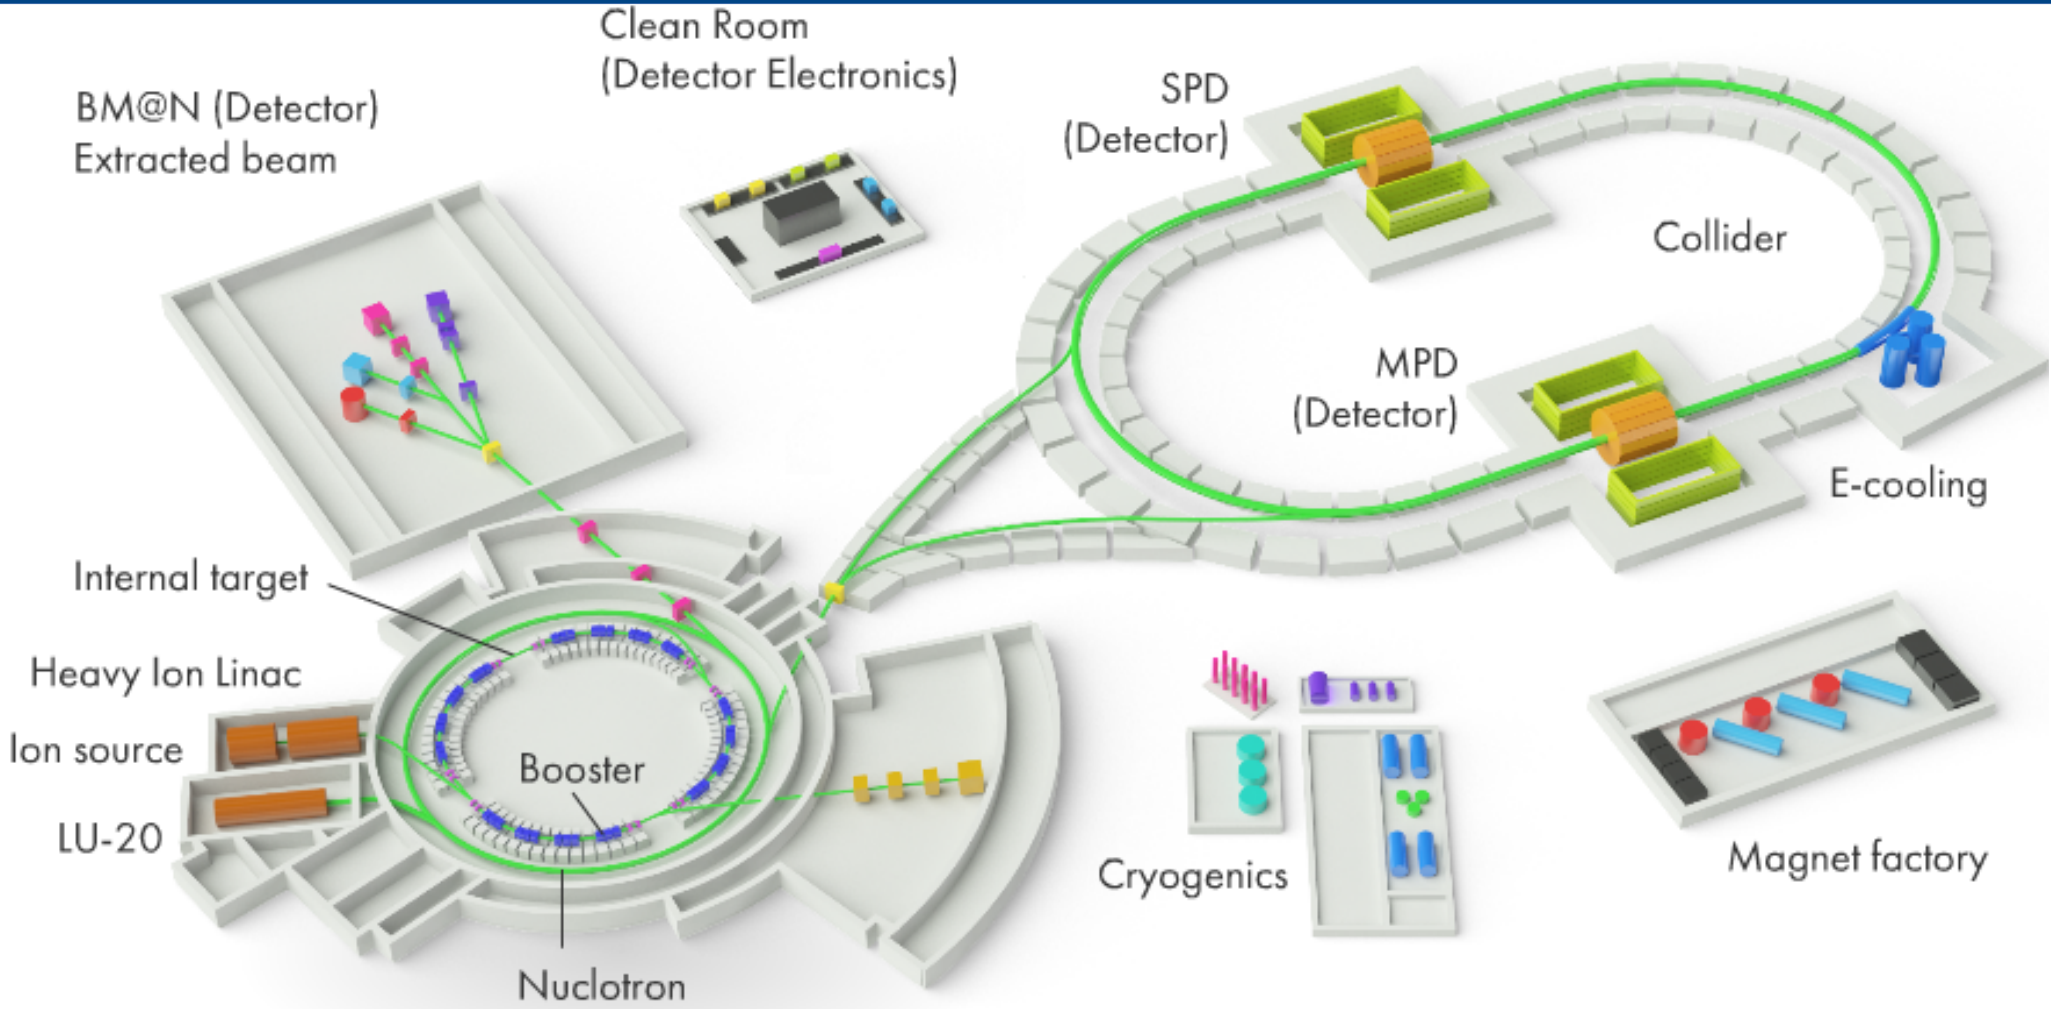


* State of HIC experiments
* Study Hot and Dense Barionic Matter
* Highest Net Barion Density
* Equation of State, Bulk properties
* Deconfinement, Phase Transition , Critical Point
* Observables:

Multiplicity, Spectra, Ratios, Critical phenomena,
Collective Flow, strangeness enhancement,
Event-by-event fluctuations, Femtoscopy,
EM decays of resonances and much more

NICA White Paper and CBM Physics Book

Nuclotron-based Ion Colider fAcility NICA

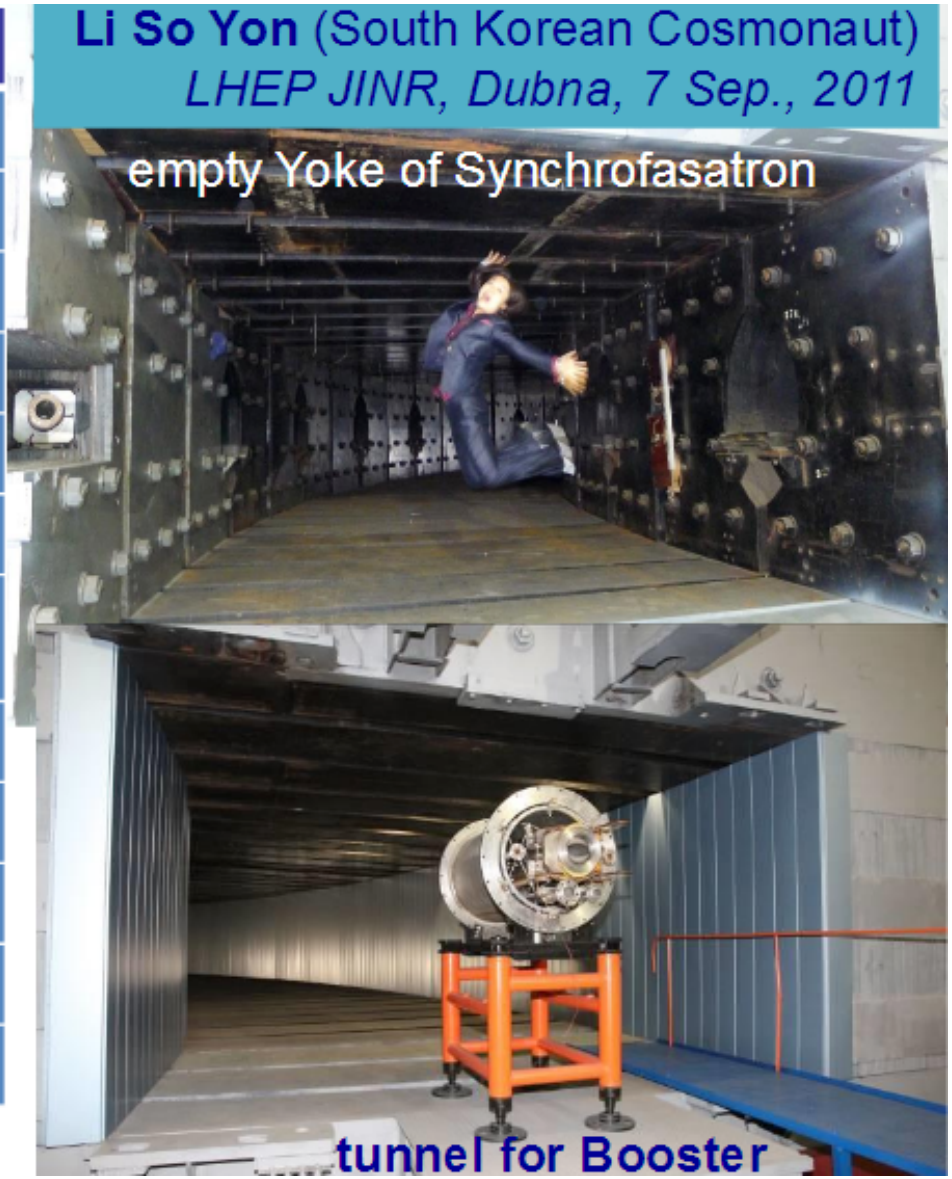


* Cryogenics: 8 kW, He @ 4.5K, 1000 l/h
* Magnet factory – SC magnets for booster, collider and SIS-100
* Injection complex: 4 sources, 2 linacs
* Booster,* Nuclotron * Collider
* AA (up to $^{197}Au^{79+}$), AB, pp and dd polarized beams
* 3 Detector Programs: BM@N, MPD, SPD

* $\sqrt{s_{AuAu}} = 11$ GeV
* $L_{AuAu} = 10^{27}\,cm^{-2}s^{-1}$
* $\sqrt{s_{pp}} = 27$ GeV
* $L_{pp} = 10^{32}\,cm^{-2}s^{-1}$

NICA - Booster

Parameter	Booster
type	SC synchrotron
particles	ions A/Z ≤ 3
injection energy, MeV/u	3.2
maximum energy, GeV/u	0.6
magnetic rigidity, T m	1.6 – 25.0
circumference, m	210.96
cycle for collider mode, s	4.02 (active); 5.0 (total)
vacuum, Torr	10^{-11}
intensity, **Au** ions/pulse	$1.5\ 10^{9}$
transition energy, GeV/u	3.25
RF range, MHz	0.5 -2.53
spill of slow extraction, s	up to 10



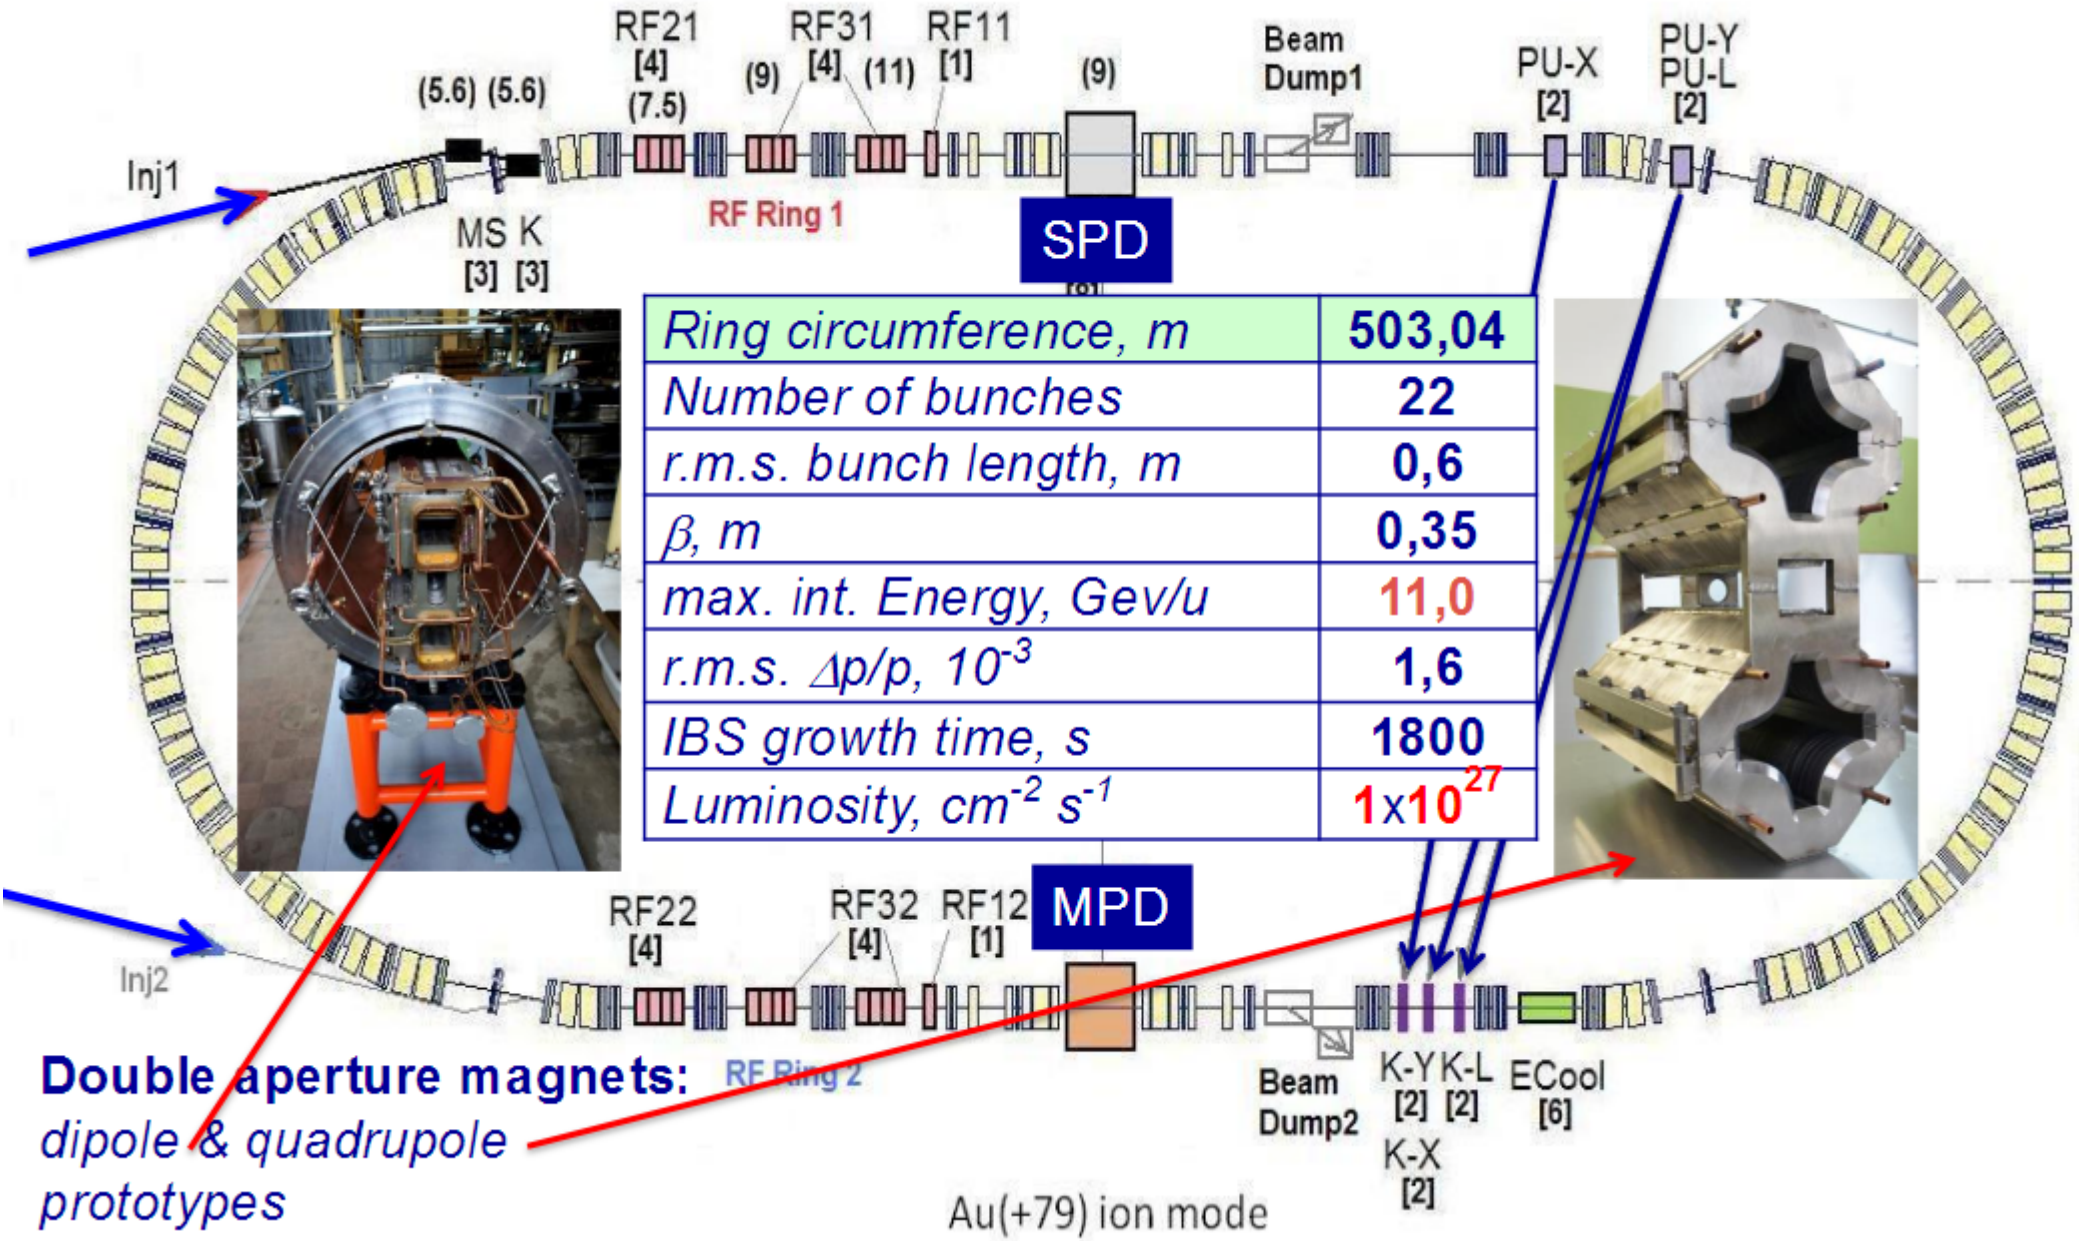
NICA - Nuclotron

Parameters	Nuclotron
type	SC synchrotron
particles	↑ p,↑d, nuclei
injection energy, MeV/u	5 (↑p,↑d) 570-685 (Au)
max. kin. energy, GeV/u	12.07 (↑p); 5.62 (↑d) 4.38 (Au)
magnetic rigidity, T m	25 – 43.25
circumference, m	251.52
cycle for collider mode, s	1.5-4.2 (active); 5.0 (total)
vacuum, Torr	10^{-9}
intensity, **Au** ions/pulse	$1\ 10^{9}$
transition energy, GeV/u	7.0
RF range, MHz	0.6 -6.9 (↑p,↑d) 0.947 – 1.147 (nuclei)
spill of slow extraction, s	up to 10

*modernized in **2010-2015***

NICA - Collider

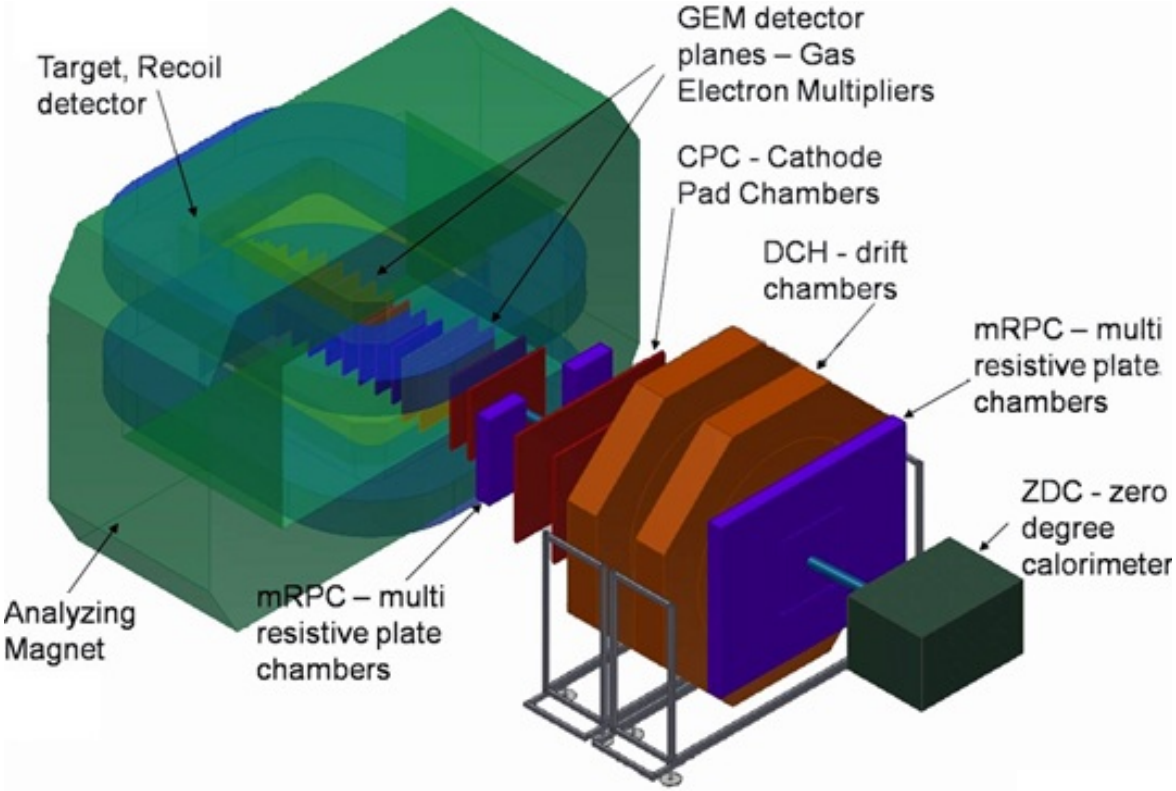
45 T*m, *4.5 GeV/u for* Au^{79+}



Ring circumference, m	**503,04**
Number of bunches	**22**
r.m.s. bunch length, m	**0,6**
β, m	**0,35**
max. int. Energy, Gev/u	**11,0**
r.m.s. Δp/p, 10^{-3}	**1,6**
IBS growth time, s	**1800**
Luminosity, $cm^{-2}\ s^{-1}$	1×10^{27}

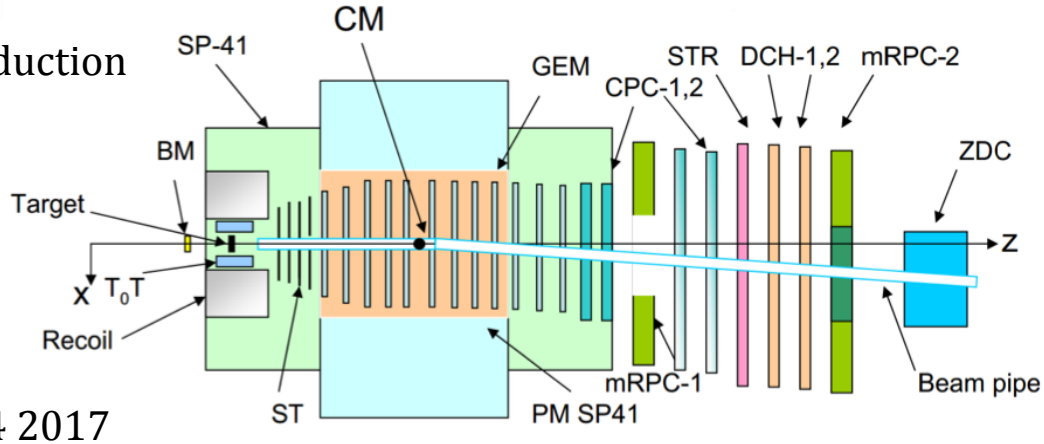
Double aperture magnets:
dipole & quadrupole prototypes

Baryonic Matter at Nuclotron BM@N



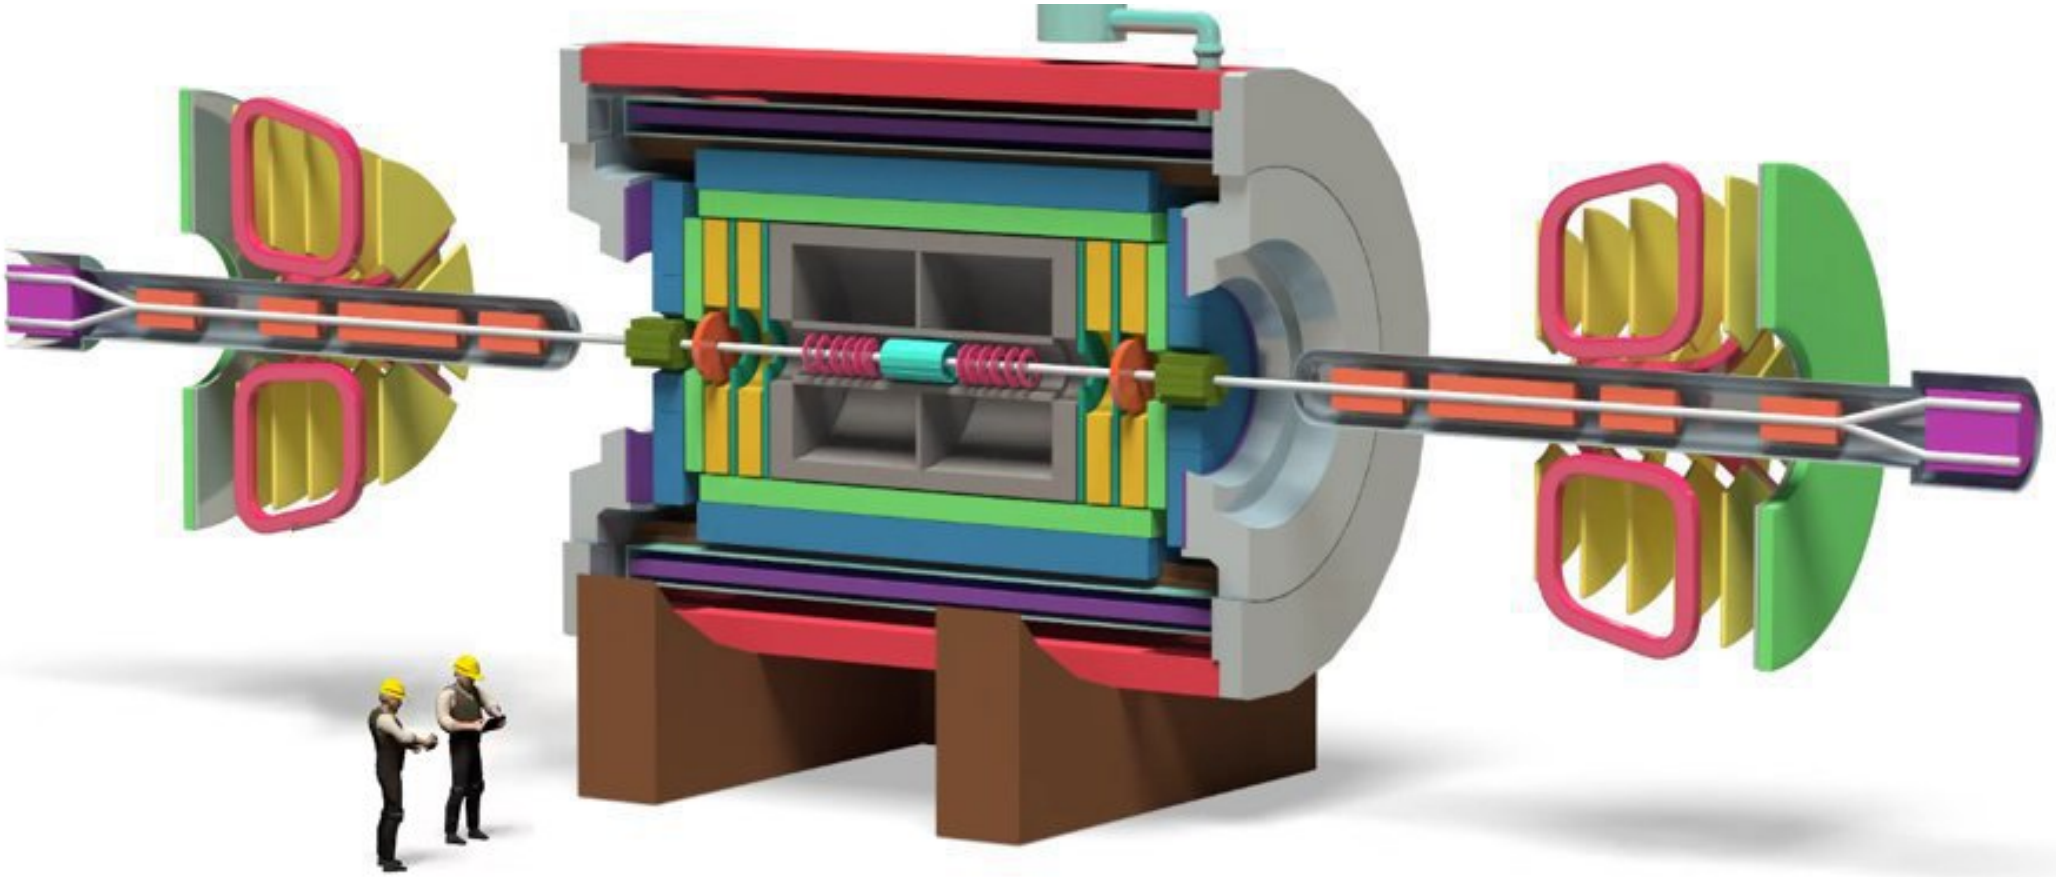
* Central tracker (GEM+Si) inside analyzing magnet to reconstruct particle momentum
* Outer tracker (DCH, Straw / CPC) behind magnet to link central tracks to ToF detector
* ToF system based on mRPC detectors to identify hadrons and light Nuclei
* ZDC calorimeter to measure centrality of AA collision
* Detectors to form T0, L1 centrality trigger and beam monitors
* EM calorimeter for γ,e+e

* strange / multi-strange hyperon and hypernuclei production
* hadron femtoscopy
* in-medium modifications of strange & vector mesons in dense nuclear matter
* electromagnetic probes, states decaying into γ, e



Technical runs with d, Li, C beams: 2015 – 2017;
Physics run BM@N (I stage) with Xe int rate 20 kHz: Q4 2017
Physics run BM@N(II stage) with Au int rate 50 kHz: 2019

Multi-Purpose Detector MPD



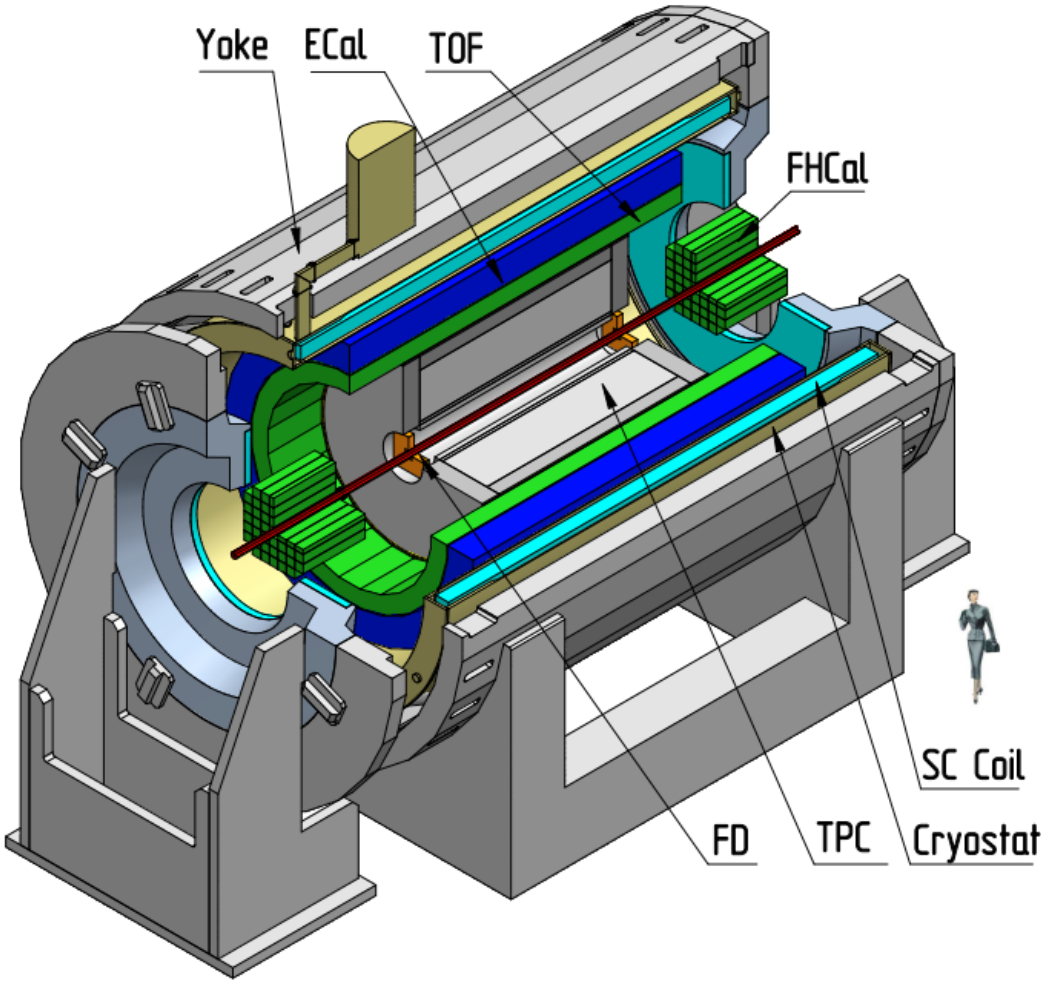
Three stages are planned

1. Barrel setup: TPC, TOF, ECal, FHCal, FFD (by the end of 2020)

2. Addition of IT and GEM close to interaction point

3. Addition of Forward Spectrometers for forward(backward) rapidity

MPD stage 1

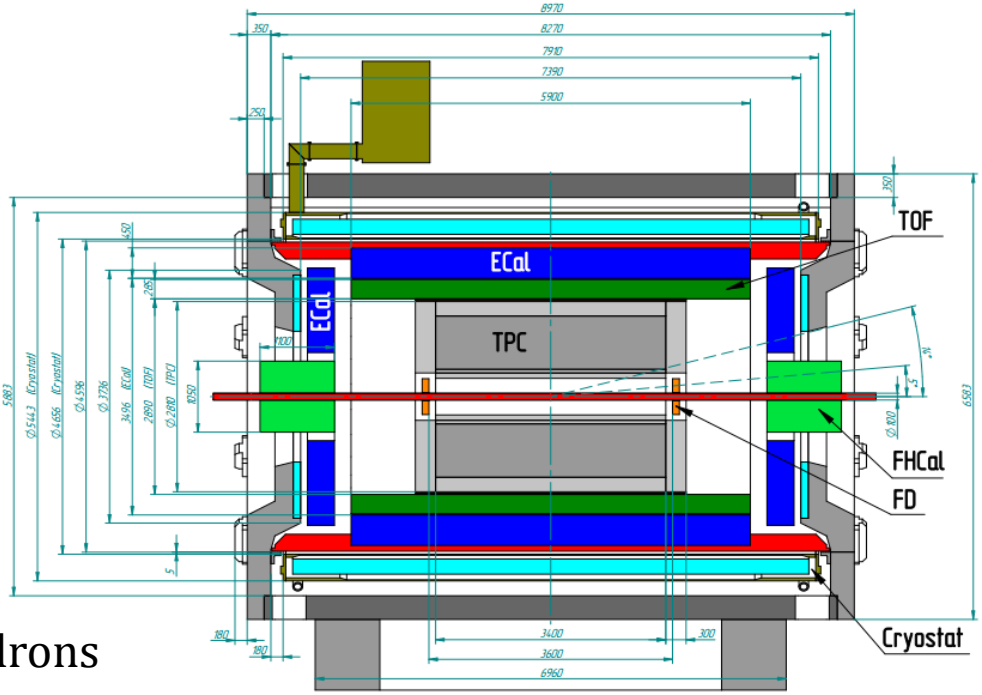


Required features:

* Precise tracking and ID
* High Multiplicity and Rate
* Low Material Budget

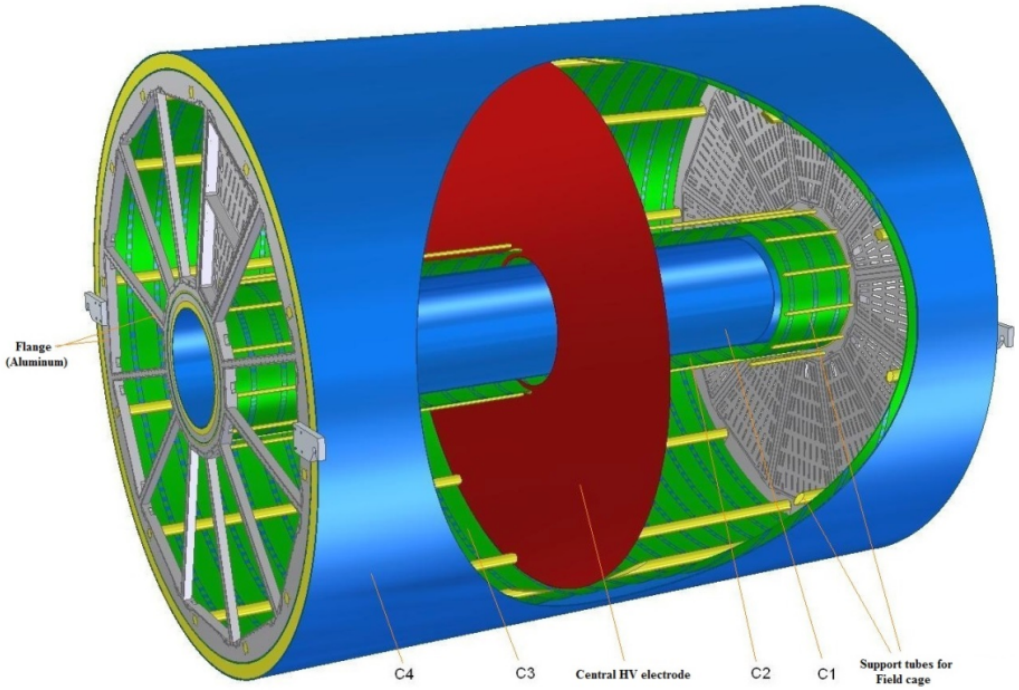
1st stage:

TPC Time Projection Chamber
TOF Time of Flight System
ECal Electromagnetic Calorimeter
FHCal Forward Hadron Calorimeter
FFD Fast Forward Detector

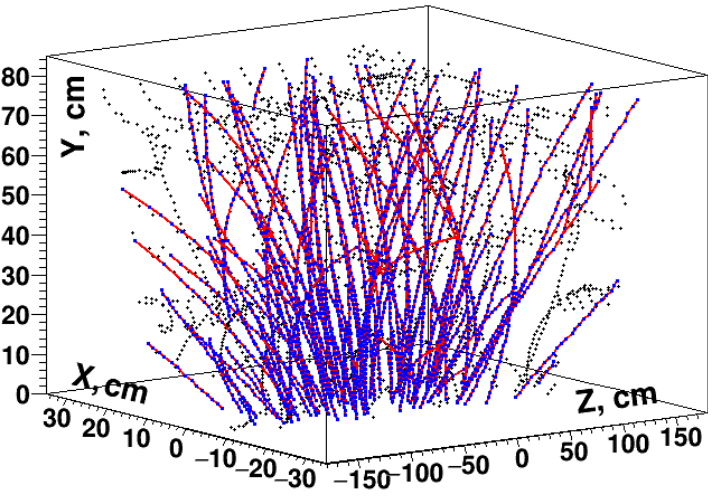


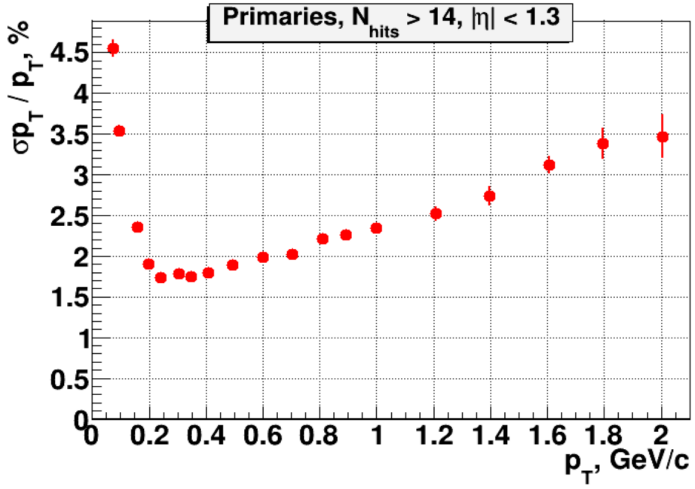
* Particle yields and spectra
* Event-by-event fluctuations
* Femtoscopy involving π, K, p, Λ
* Collective flow for identified and reconstructed hadrons
* Electromagnetic probes (electrons, gammas), vector, mesons

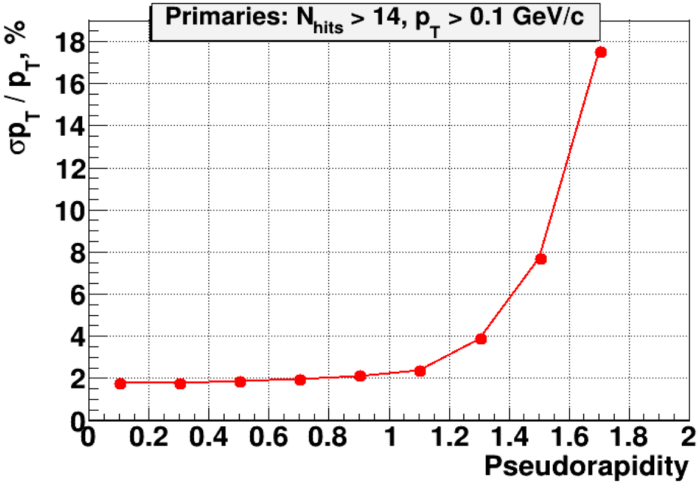
Time-Projection Chamber TPC



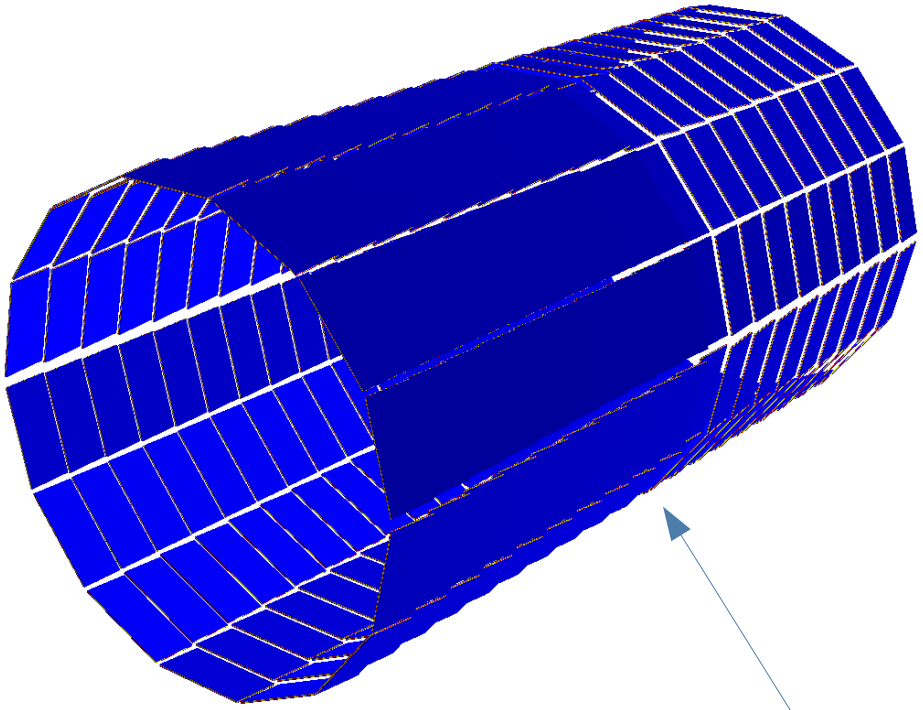
* Main tracking detector for MPD
* Provides dE/dx through charge collection
* Central HV anode, Ar/CH4 (90/10) gas,
* MWRPC and Cathode Pad Readout
* Energy Loss resolution of ~8%
* Precise tracking and Particle Identification
* Accurate determination of primary vertex
* Precise p_T resolution up to $|\eta| < 1.5$
* Most prototyping done, mass production

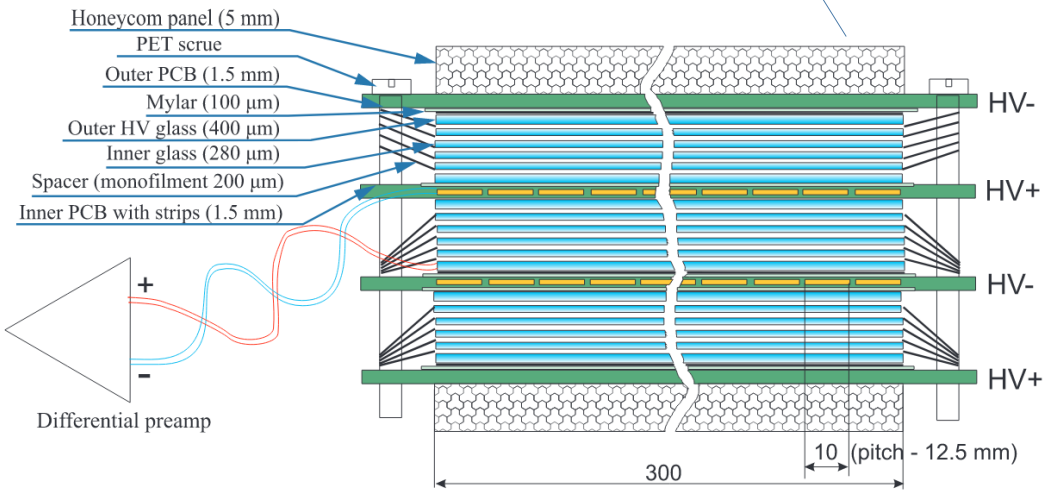






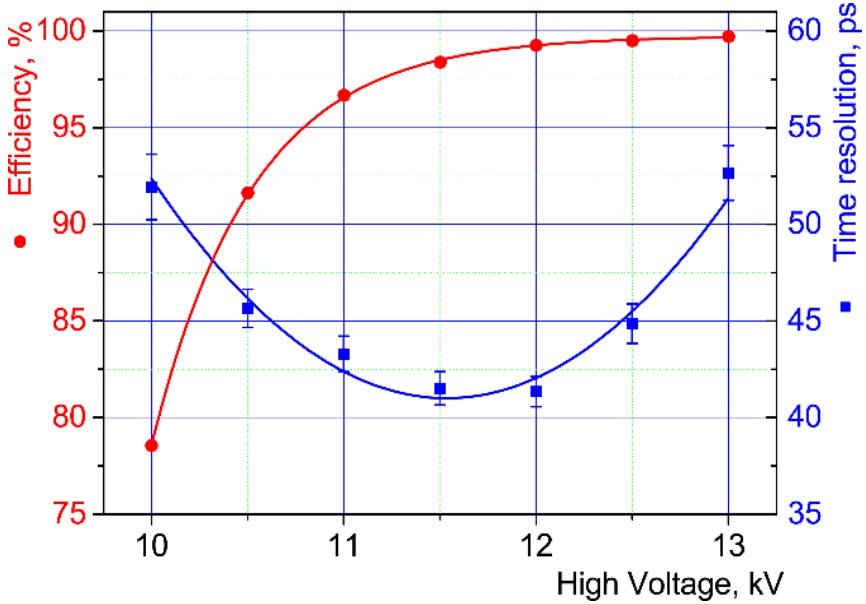
Time of Flight System TOF





* Three stacks of
  Multi-gap Resistive Plate Chambers
* Main elementin of
  TOF-400 and TOF-700 walls at BM@N,
  TOF-Barrel and TOF-Endap at MPD.
* Fast Front-end electronics (NINO based)
* TOF hits matched with TPC tracks
* Provides time of particle flight which along with momentum is used for velocity or mass determination and particle identification.

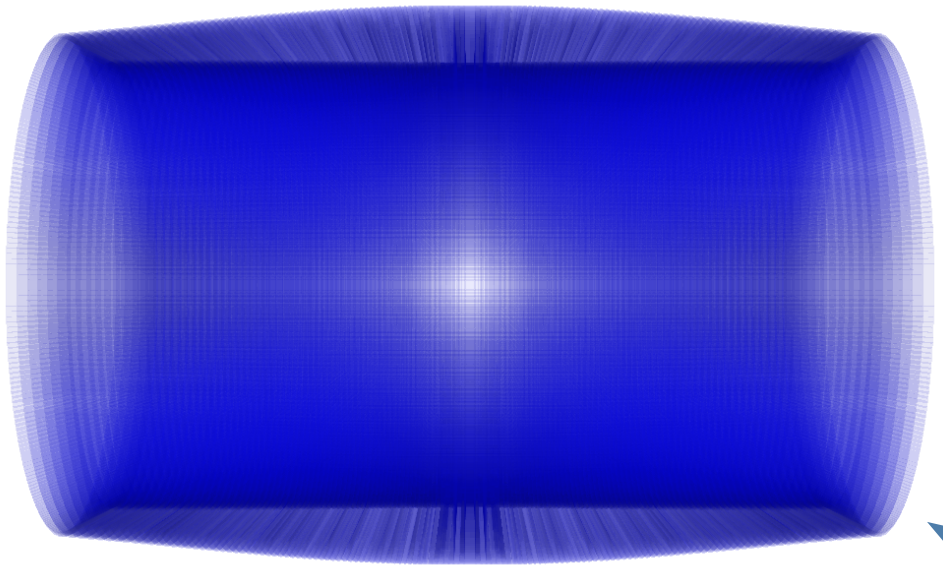
$$M^2 = (p/q)^2 \left(\frac{c^2 t^2}{l^2} - 1 \right)$$



BM@N December 2016 test run:

* Time resolution of ToF-700 chamber ~65 ps
* Time resolution of ToF-400 chamber ~53 ps

Electromagnetic Calorimeter ECal



* ECal will provide measurements for electromagnetic and hadronic showers
* Modules are a shashlyk (skewer) type

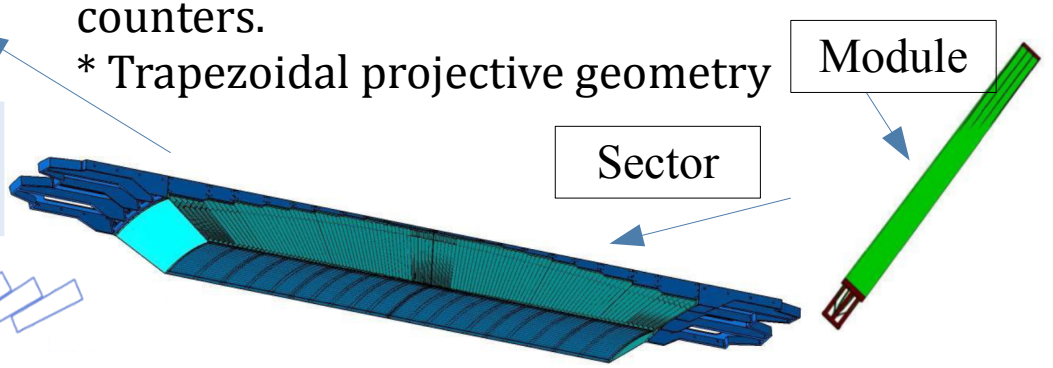
Total number of modules : 43008

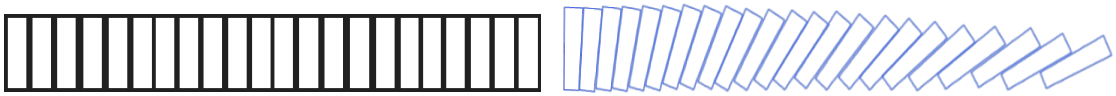
221 Pb plates (0.3 mm)

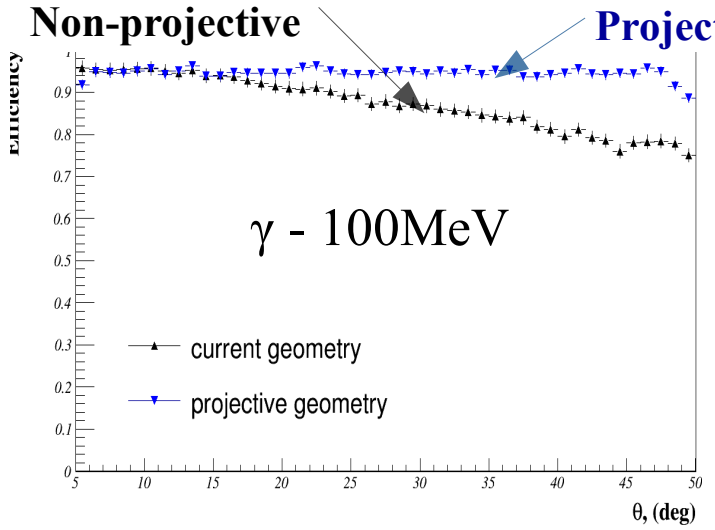
221 FscScint C_9H_{10} (1.5 mm)

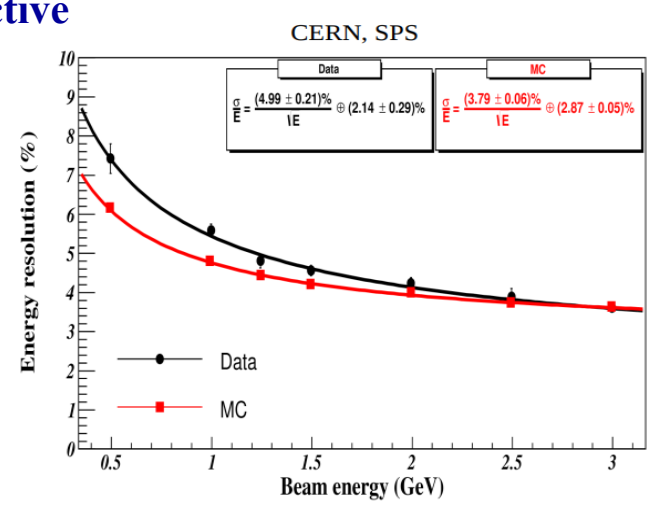
* Light is carried by Wave Length Shifting Fibers to HAMAMATSU MAPD photon counters.
* Trapezoidal projective geometry

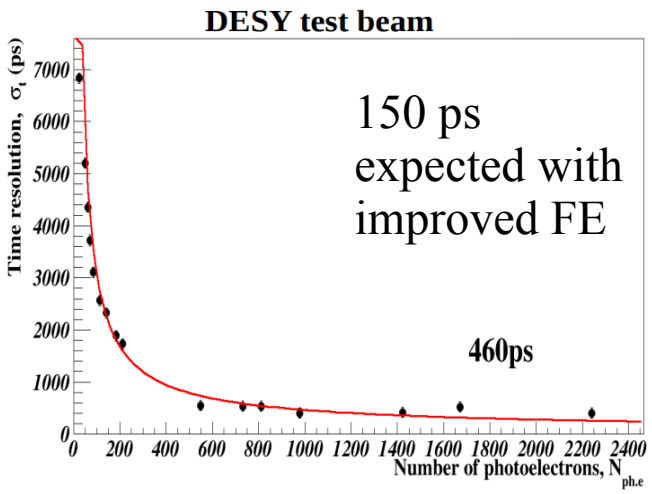
Please take a look at Boyana Dabrowska's talk
24.10 -17:35 h - Petrovskiy hall



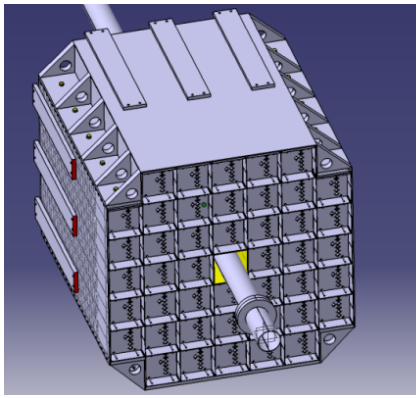


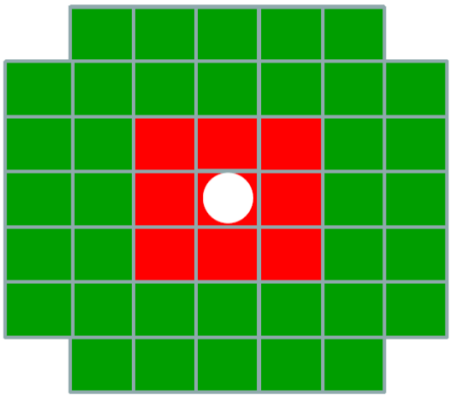


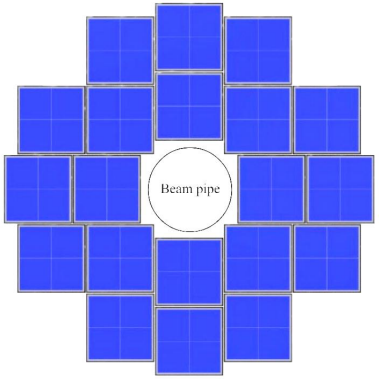


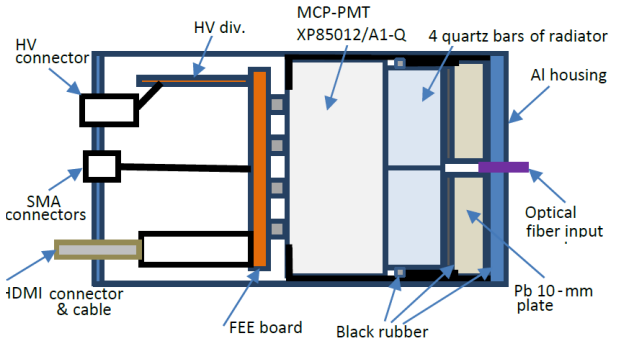


Forward Hardron Calorimeter FHCal, Fast Forward Detector FFD







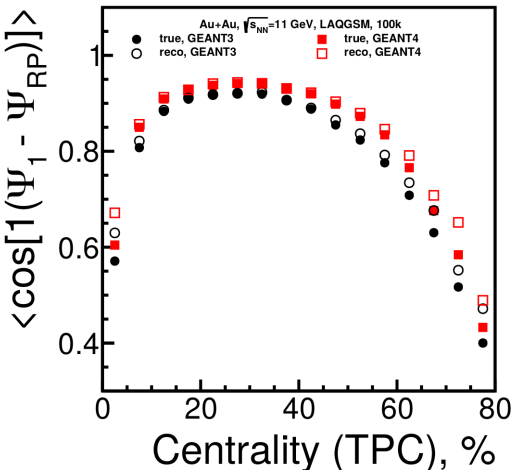


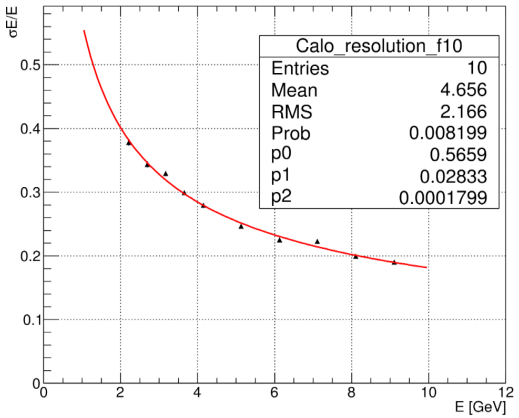
Measures the energy of non-interacting nucleons and fragments (spectators) in AA collisions. Lead-scintilator, WLS fibers, MAPD

Main goals of FHCal:
* May help in Centrality Determination
* Important for Event-Plane reconstruction

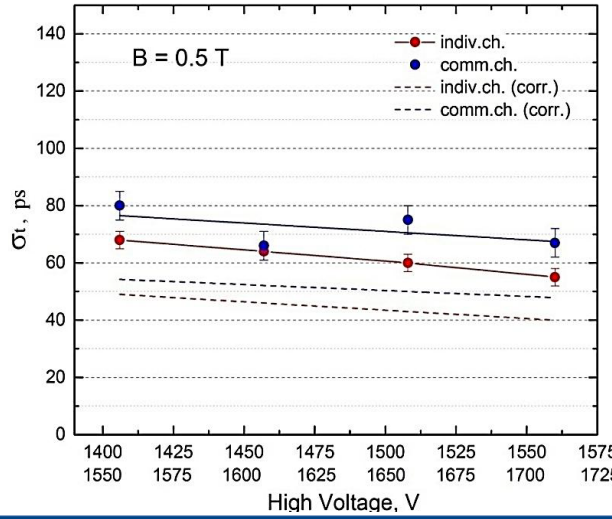
Detects high-energy photons by conversion to electrons in a 10 mm Pb plate The electrons pass through a quartz radiator generating Cherenkov light, collected by a photo cathode

Main goals of the FFD:
* Fast and effective triggering of collisions
* Generation of the start pulse for the TOF

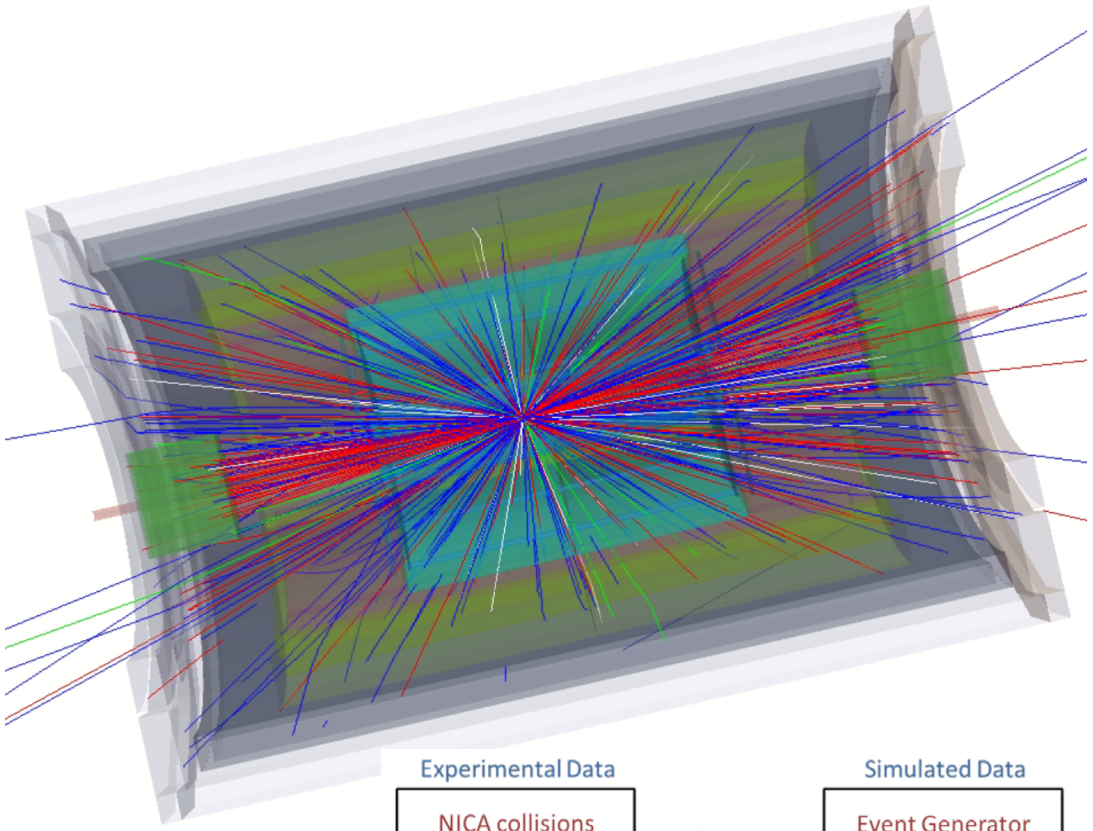


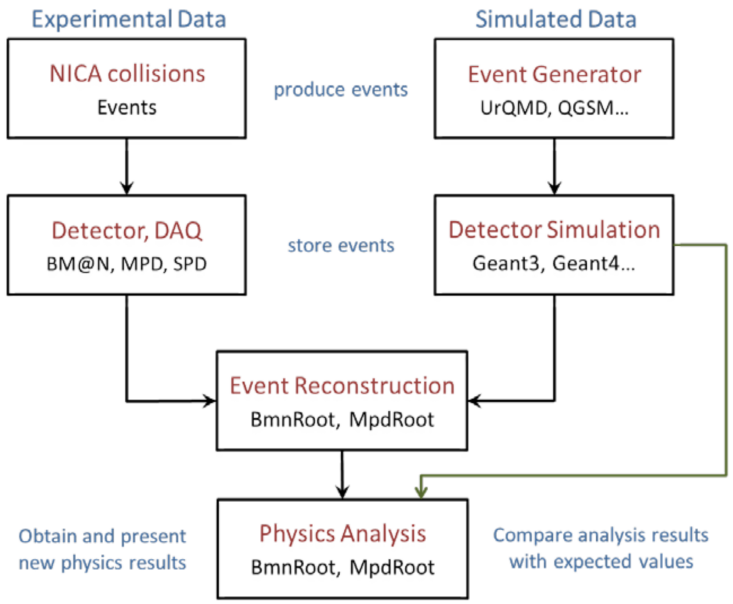


* Time resolution of module(+electronics) in MPD is $\sigma_{FFD} \approx 44$ ps

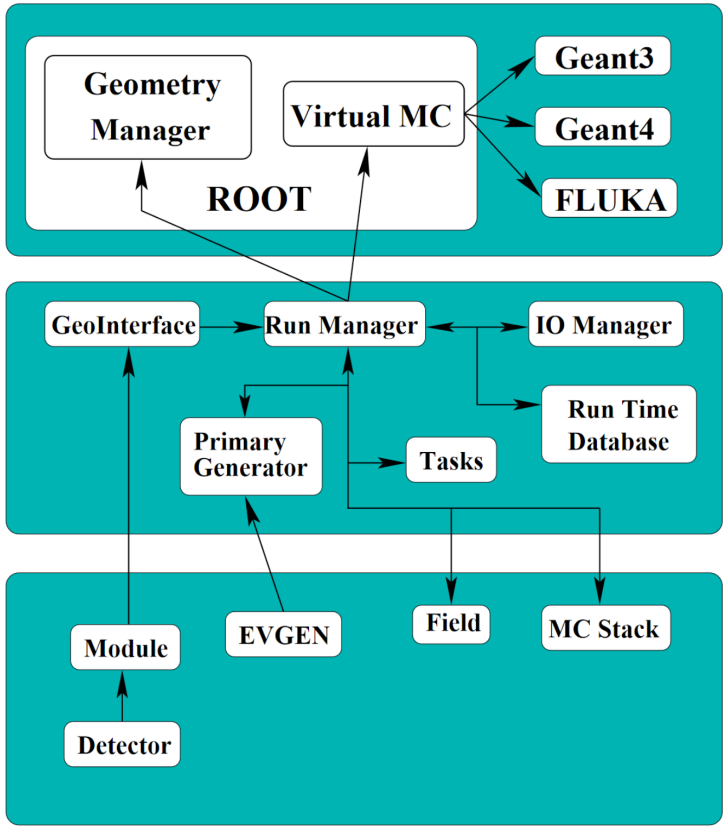


MPDROOT: Software and Analysis

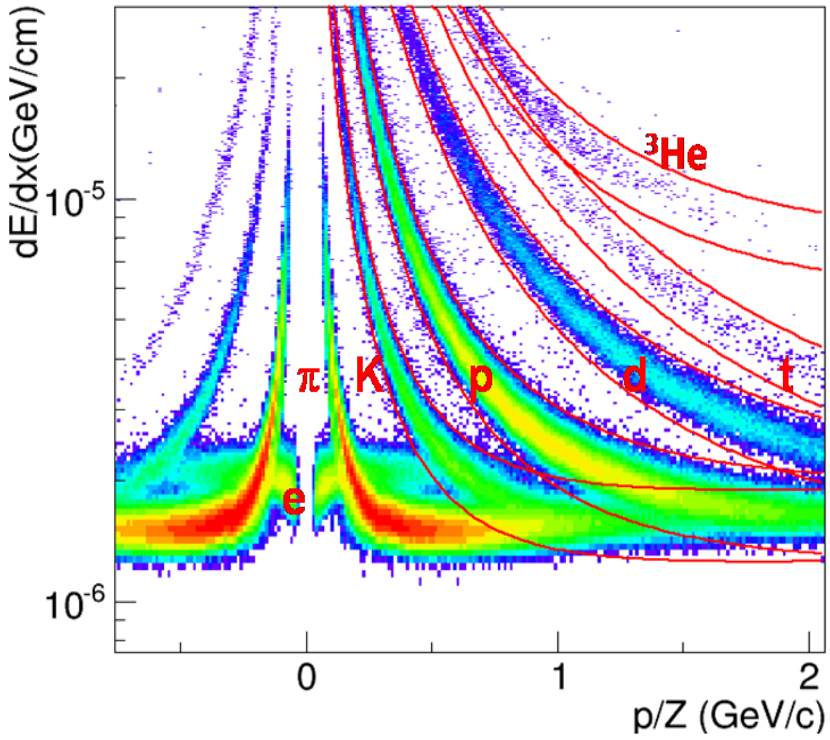


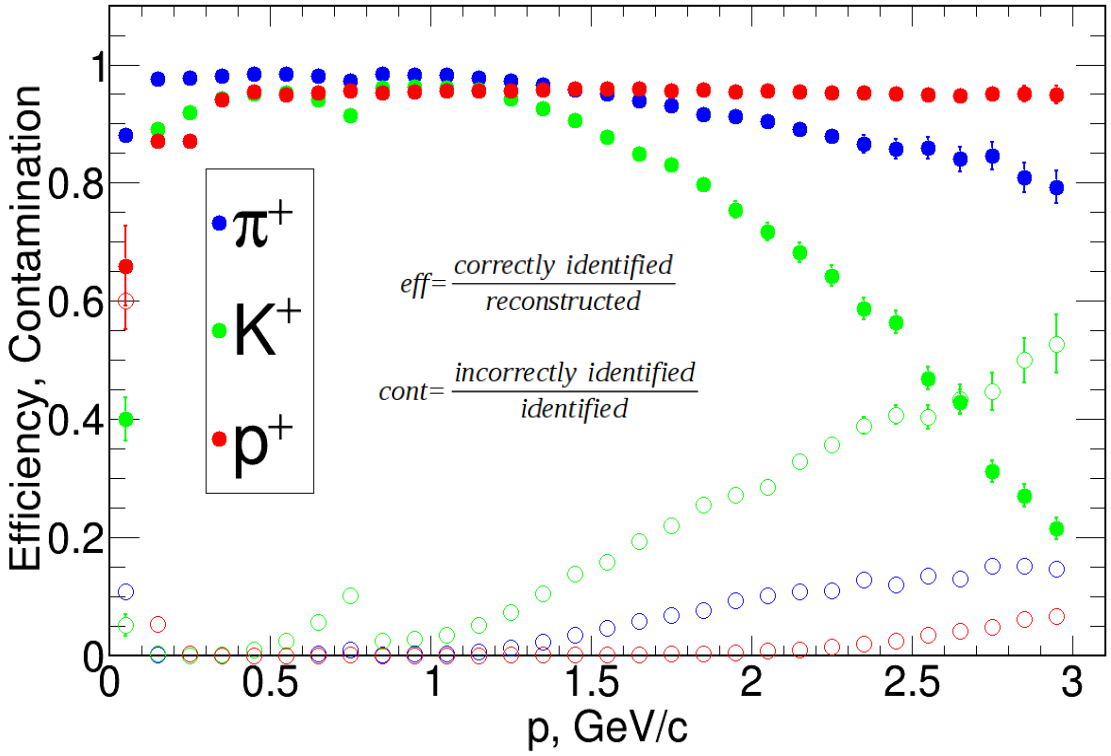


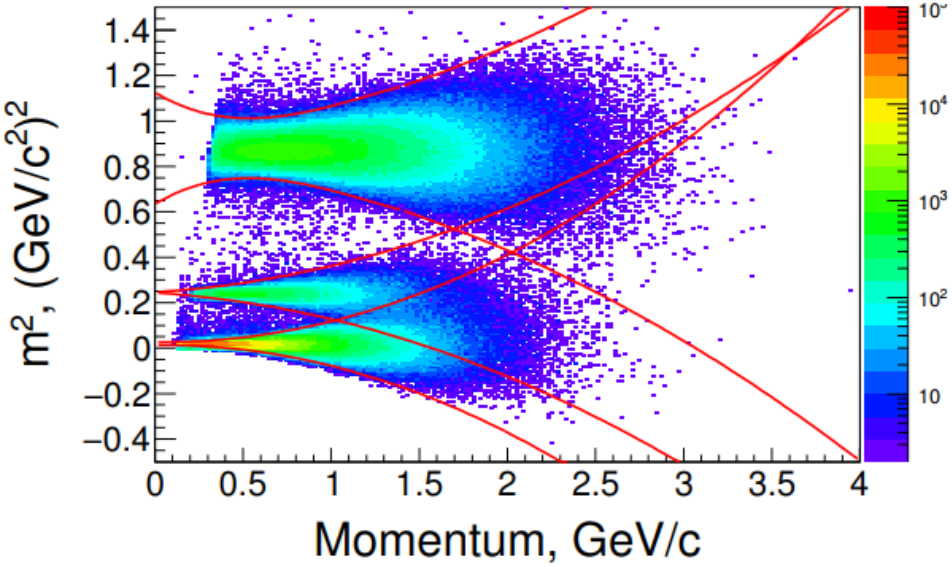
* MPDROOT is based on FAIRROOT
* Has good modularity
* Provides interfaces for event generators
* Full MC simulation chain, Geant4
* Realistic event reconstruction
* Tools for detector performance est.
* Physics analysis frameworks for simulated feasibility studies (real data studies eventually)



Particle Identification







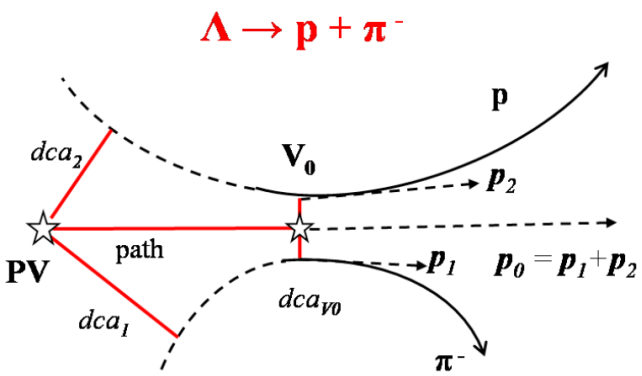
Particle Identification Based on:

* Energy Loss in TPC
* Mass^2 based on TOF
* Multiplicity parametrization

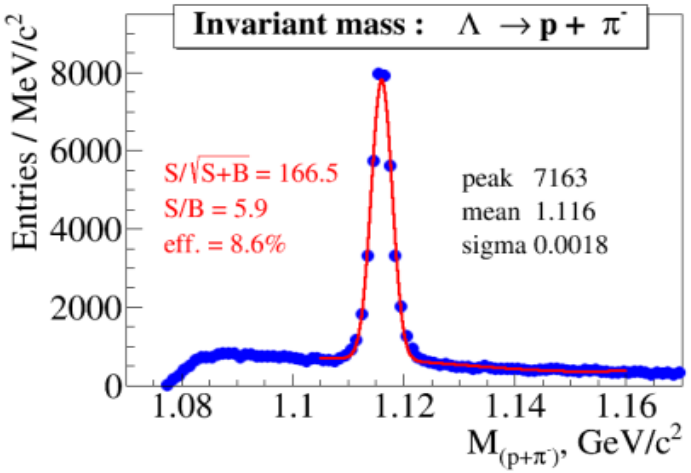
* π/K separation up to 1.5 GeV/c
* π/p separation up to 3 GeV/c

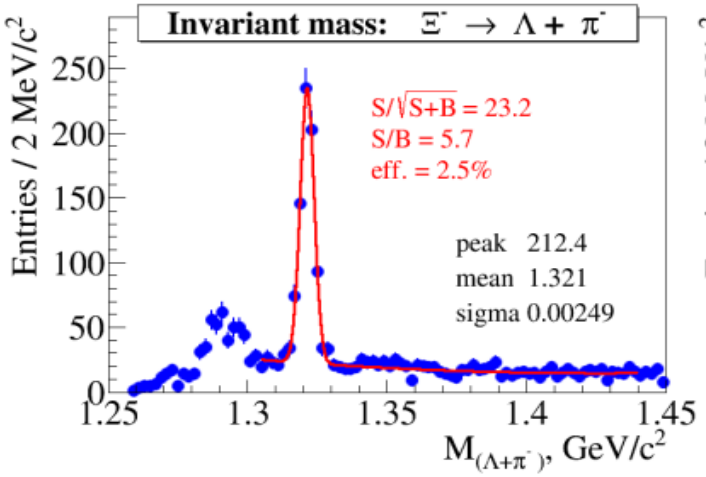
A A Mudrokh and A I Zinchenko
doi:10.1088/1742-6596/798/1/012071

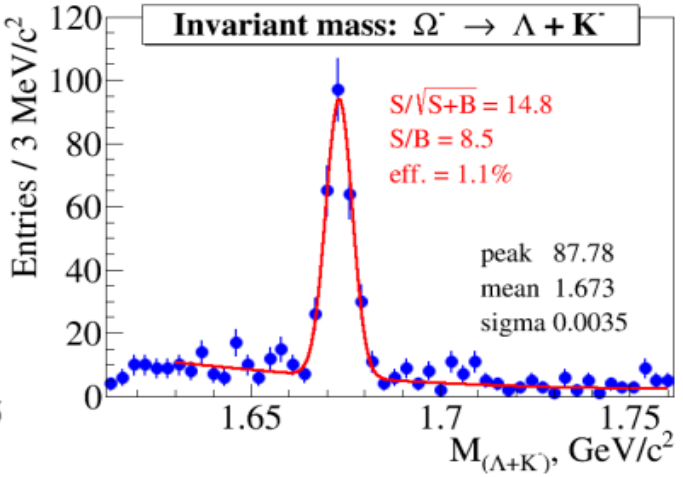
Hyperon Reconstruction at MPD



* Production of strange particles is of particular Interest.
* Enhanced production of multi-strange hadrons in A+A collisions (Ξ, Ω) (relative to pp) was predicted as a signal for the QGP formation.
* The enhancement of the strangeness was observed at SPS and RHIC, and is more pronounced for hyperons with larger strangeness content







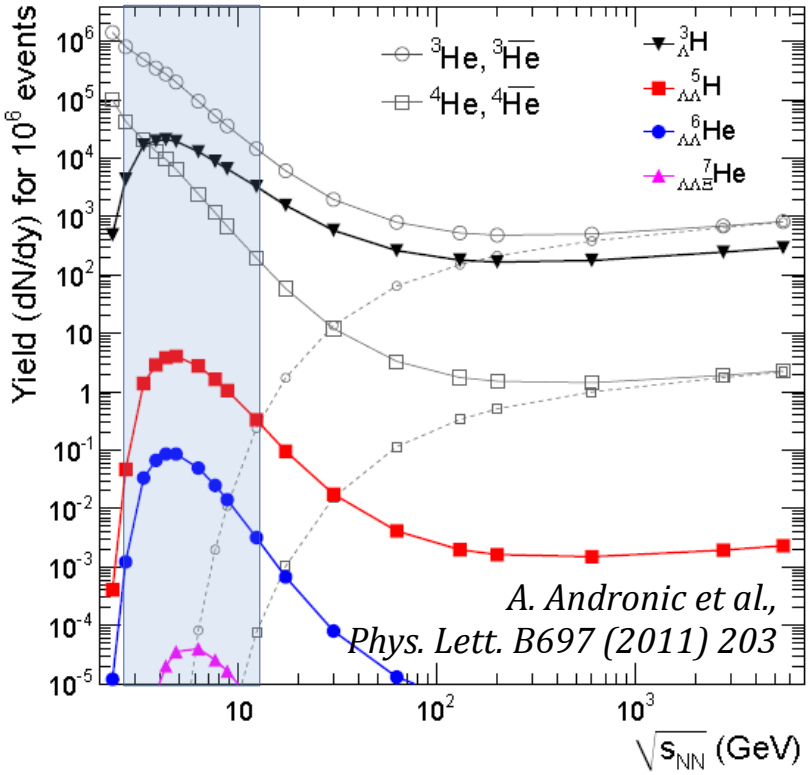
Yields for 10 weeks

Particle	Λ	$\bar{\Lambda}$	Ξ^-	$\bar{\Xi}^+$	Ω^-	$\bar{\Omega}^+$
Expected yield	$5.8 \cdot 10^9$	$7.3 \cdot 10^7$	$2.9 \cdot 10^7$	$1.6 \cdot 10^6$	$1.4 \cdot 10^6$	$2.9 \cdot 10^5$

D. Suvarieva, A. Zinchenko et al.
doi:10.1088/1742-6596/668/1/012121

Please take a look at Alexander Zinchenko's talk
26.10 – 16.05 h - Moskovorechye hall

Hypernuclei Reconstruction at MPD



* Production of hypernuclei through coalescence of Λ with light fragments is enhanced at high baryon densities

* Maximal yield predicted forNICA energy ranges (stat model) (interplay of Λ and light nuclei excitation function)

~ 10^6 $^3_\Lambda$H are expected in 10 weeks

Please take a look at Mariya Ilieva's talk
24.10 -17:50 h - Petrovskiy hall

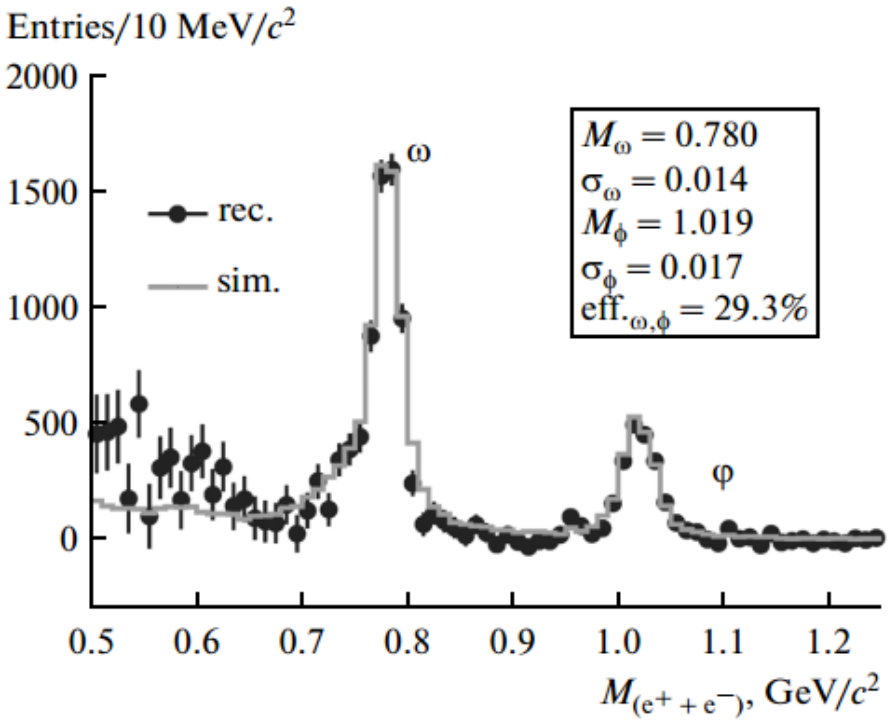
Dileptons (EM probes)

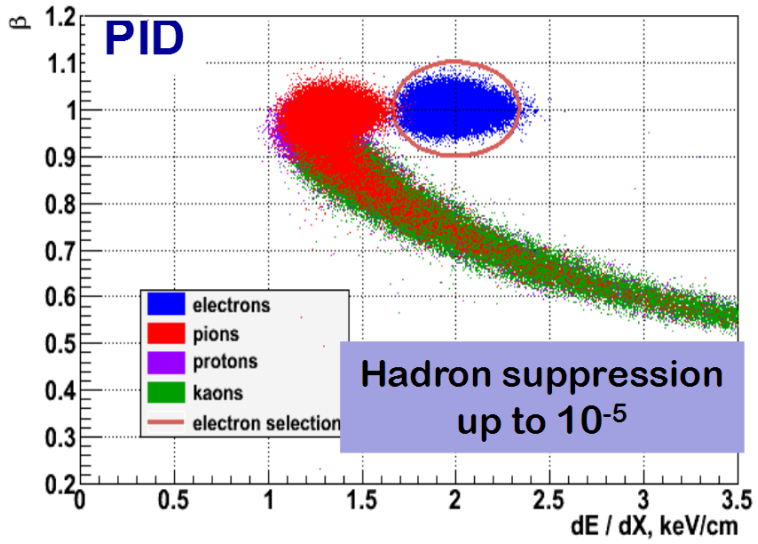
Dileptons can be emitted by a variety of sources. Reconstruction of low-mass vector mesons ρ, ω, ϕ by measuring their dileptonic decay channels is one of top priorities...

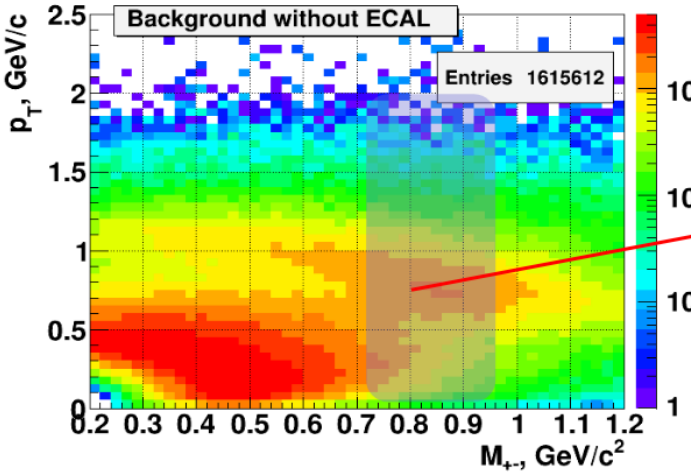


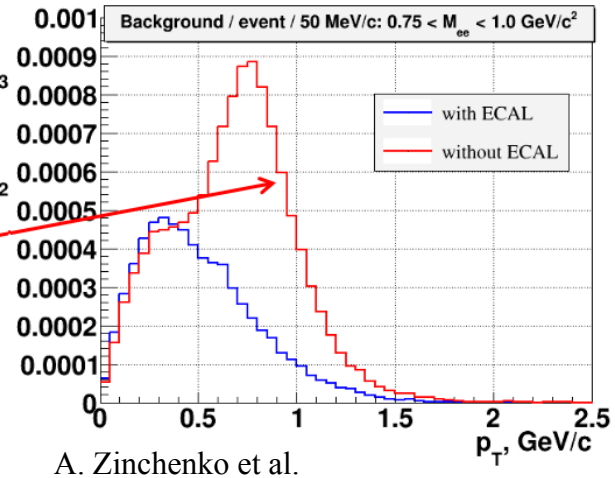
Good probes to indicate medium modifications of spectral functions due to chiral symmetry restoration in HIC; (The effect is proportional to baryon density)

Yields, central Au+Au st $\sqrt{s_{NN}}$ = 8.8 GeV/u

meson	Yields		Yield/1 w
	4π	y=0	
ρ	31	17	$7 \cdot 10^4$
ω	20	11	$7 \cdot 10^4$
φ	2.6	1.2	$1.7 \cdot 10^4$

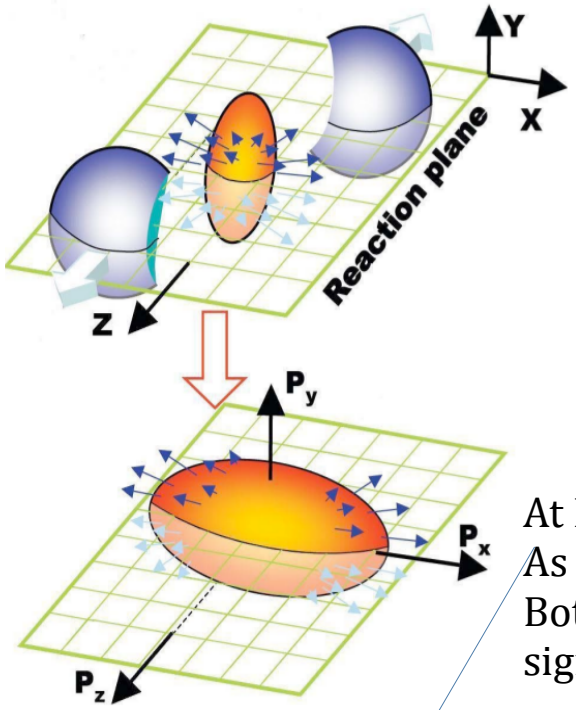






A. Zinchenko et al.
doi:10.1134/S1063778815130359

Anisotropic Flow at MPD



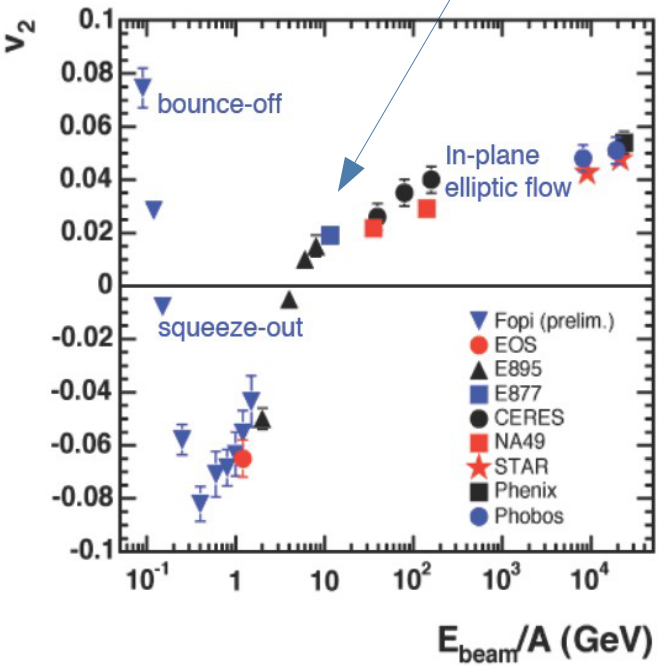
In HIC a non-zero imp par leads to:
* Spatial anisotropy
* Pressure gradiet
* Momentum anisotropy
* Fourier expansion→Flow v_n

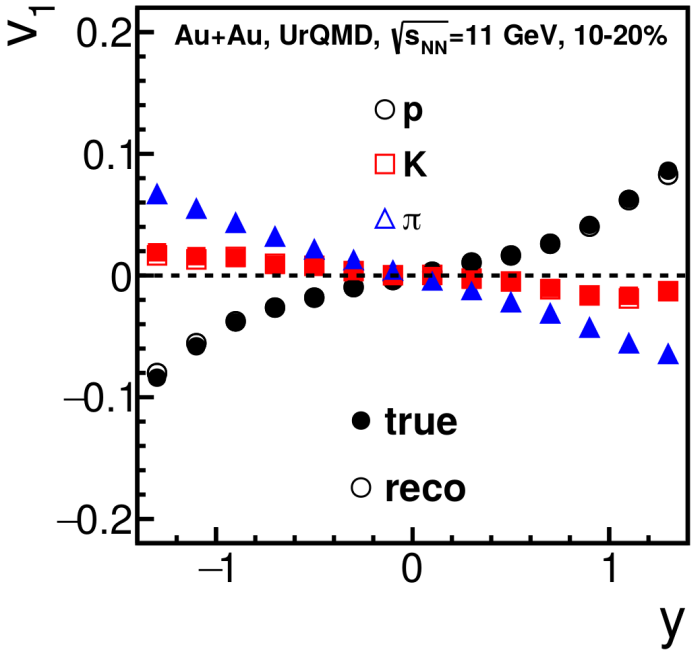
$$v_n(p_T, y) = \langle \cos[n(\phi - \Psi_n)] \rangle$$

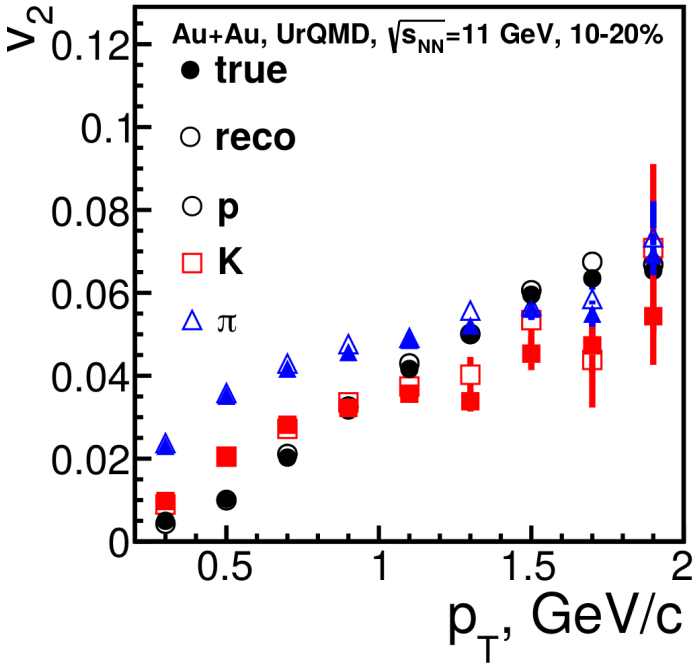
At Nuclotron-NICA energy range elliptic flow
As a function of energy changes sign.
Both directed and elliptic flow can
signal a first order phase transition

* FHCal is used to determine the event-plane angle
* Better event-plane resolution
* Event-plane not dependent on TPC tracking
* The RECO and TRUE values of differential flow coefficients are in a good agreement.

Please take a look at Peter Parfenov's poster (Petrovskiy hall)







proton-proton collision studies at MPD

The study of observables in proton-proton collisions and other light systems establish a baseline for nucleus-nucleus interaction studies

* A good tool for detector performance studies
* Study of fluctuations and correlations of in-medium properties as function of the system size.
*R_{AA} – nuclear modification factor
*Horn effect, etc.

Please take a look at Katherin Shtejer's talk
26.10 -16:35 h - Moskvorechye 1 hall

Civil engineering

Collaboration

At present, JINR has 18 full member and 6 associate member states from 5 continents.
30 countries are interested and taking part in the NICA collaborations.

The second collaboration meeting of the MPD and BM@N experiments at the NICA Facility will be held at JINR/VBLHEP on on October 29-30, 2018

Welcome to join the NICA collaborations!

Summary

In the landscape of Heavy Ion Collisions the NICA accelerator facility will provide a wide range of experiments, collision energies, system sizes and physics observables.

The Multi-Purpose Detector is designed with a good acceptance, low material budget in a modular configuration with three upgrade stages. The main sub-detector systems of MPD are near the end of design stages and mass production and assembly will start soon.

Several Feasibility Studies, based on realistic monte carlo simulations highlight the good capabilities of MPD and the viability of several research programmes.

The NICA community is open to accept new collaboration proposals.

Thank you!
