

Measurement of variations in the flux of atmospheric muons using underground LVD detector

Tuesday, 23 October 2018 09:30 (15)

Data on the measurement of the flux of atmospheric muons by a scintillation detector LVD at 3300 m w.e. depth with an average energy of 280 GeV are presented. The results of measuring the seasonal variation of the muon flux over 25 years of observations are discussed.
