Fragments formation within PHQMD and do we really we need it?

Introduction

At **3 A.GeV** even in **central** collisions almost **20%** of the baryons are bound in the clusters

Without dynamical fragments formation we cannot properly describe observables like v1, v2, p_{τ} spectra,

Many present transport models fail to describe fragments at NICA/FAIR (and higher) energies. We made a new one.

(it's a lot

PHSD

E.L. Bratkovskaya, W. Cassing, Nucl.Phys. A856 (2011) 162-182.

Initial A+A collisions – HSD: string formation and decay to pre-hadrons

Fragmentation of pre-hadrons into quarks: using the quark spectral functions
from the Dynamical QuasiParticle Model (DQPM) approximation to QCD
DQPM: Peshier, Cassing, PRL 94 (2005) 172301; Cassing, NPA 791 (2007) 365: NPA 793 (2007)

Partonic phase: quarks and gluons (= "dynamical quasiparticles") with off-shell spectral functions (width, mass) defined by DQPM

Hadronization: based on DQPM - massive, off-shell quarks and gluons with broad spectral functions hadronize to off-shell mesons and baryons: gluons \rightarrow q + qbar; q + qbar \rightarrow meson (or string); q + q +q \rightarrow baryon(or string)(strings act as ,doorway states' for hadrons) Hadronic phase: hadron-string interactions – off-shell HSD ³

FRIGA

A. Le Fèvre et al., J. Phys.: Conf. Ser. 668 (2016) 012021.

1) Pre-select good «candidates» for fragments according to proximity criteria: real space coalescence = Minimum Spanning Tree (MST) procedure.

2) Take randomly 1 nucleon out of one fragment

3) Add it randomly to another fragment

<u>If E' < E</u> take the new configuration <u>If E' > E</u> take the old with a probability depending on E'-E Repeat this procedure very many times... It leads automatically to the most bound configuration.

Parton-Hadron Quantum Molecular Dynamics = PHSD + QMD* + FRIGA

* J. Aichelin and H. Stöcker, Phys. Lett. 176 B (1988) 14

Model predictions

Single particle spectra still the same as in PHSD

Produced particles are well reproduced at NICA/FAIR energies

Model predictions

PHQMD (MST): PHOMD (MST): 10^{3} 10^{3} Au+Au, 5 AGeV, b=0.25-2.25fm Au+Au, 5 AGeV, b=6.25-8.25fm -1 - Z = 1 $- \cdot - Z = 1$ - - 7 = 2Z=2- - 2 < Z < 30time=125 fm/c time=125 fm/c -2 < Z < 30 10^{2} 10^{2} $- \star - Z > 30$ $- \star - Z > 30$ **-**•-Λ **-** • **-** Λ 10¹ 10^{1} dN/dy dN/dy 10 10⁰ **10**⁻¹ **10**⁻¹ -2.0 -1.5 -1.0 -0.5 0.0 0.5 1.0 1.5 2.0 -2.0 -1.5 -1.0 -0.5 0.0 0.5 1.0 1.5 2.0 у

(preliminary results at NICA energies)

Central collisions: light clusters; Semi-peripheral collisions: existence of heavy clusters – remnants from spectators

M_{imf} vs Z_{bound} @ 1.23 GeV

Au+Au, $E_{lab} = 1.23$ A.GeV, $t_{lass} = 16.86$ fm/c

M_{imf} vs Z_{bound} @ 2 GeV

M_{imf} vs Z_{bound} @ 4 A.GeV

Au+Au, $E_{ab} = 4.00 \text{ GeV}$, $t_{ass} = 9.35 \text{ fm/c}$

M_{imf} vs Z_{bound} @ 6 A.GeV

M_{imf} vs Z_{bound} @ 8 A.GeV

M_{imf} vs Z_{bound} @ 11 A.GeV

Why not to use just coalescence?

It fails to describe spectators

Some yields

Old

PHQMD+FRIGA may be also used for engineering stuff

We can estimate damage caused to detector

Z vs Θ @ 1.23 A.GeV

19

Ζ vs Θ @ 2 A.GeV

Ζ vs Θ @ 4 A.GeV

Ζ vs Θ @ 4 A.GeV

. .

Summary

- PHQMD can produce clusters and hypernuclei;
- Model reproduce experimental data;
- Model`s predictions can be used for analysis, feasibility and engineering studies;
- Model is actively developing.

Backup

Some yields

Fragments Z >= 2
