## The modulation of positively and negatively charged particles at 1 GV rigidity during 23-24 solar cycles

*Thursday, 1 December 2022 12:45 (15)*

Observations of monthly electron and positron fluxes made from 2006 by PAMELA experiment continue investigation of the relative modulation of positively and negatively charged particles. The comparison of the electron fluxes with proton and positron fluxes measured at about 1 GV in 23th and 24th solar cycles is presented.
