## **Exposition of the RED-100 two-phase emission detector at the Kalinin NPP for the study of coherent elastic neutrino scattering off Xenon nuclei**

*Thursday, 1 December 2022 12:45 (15)*

The RED-100 two-phase emission detector with 200 kg of liquid xenon as a working medium was exhibited at a distance of 19 m from the core of the VVER-1000/320 nuclear power reactor at the 4th power unit of the Kalinin NPP in 2021-2022. Due to its high sensitivity to weak ionization signals (down to single electrons), the RED-100 detector was used to observe elastic coherent scattering of electron antineutrinos off xenon nuclei. A set of experimental data was obtained in the regimes with the reactor on and off. The results obtained are discussed.
