Pair production of heavy quarkonia in the color evaporation model

Thursday, 1 December 2022 11:30 (15)

We study the prompt single and double J/ ψ hadroproduction in the Improved Color Evaporation Model using the Parton Reggeization Approach. We make calculations in a single manner to described the experimental data for prompt J/ ψ transverse momentum spectra from the energy of \sqrt{s} =19 GeV up to modern energy of the LHC, \sqrt{s} =13 TeV. The numerical calculations are made using parton-level MC generator for kT-depended initial-state partons, KaTie. We use the modified KMR-type unintegrated parton distribution functions of Reggeized gluons and quarks with exact normalization based on Kimber-Martin-Ryskin-Watt model. We suggest improvement of the ICEM for the pair-production of J/ ψ . In case of double J/ ψ production we investigate the relative contributions of the single-parton scattering and double-parton scattering mechanisms.
