The 6th International Conference on Particle Physics and Astrophysics MEPhI, Moscow

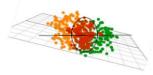

29.11-02.12.2022

### **Outline**

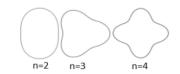

- Introduction
- Method for the transverse momentum-flow correlations measurements
- Comparison with published data
- The results at  $\sqrt{S_{NN}}$ =7.7 and 11.5 GeV for different models
- Summary and outlook

### **Elliptic flow at NICA energies**

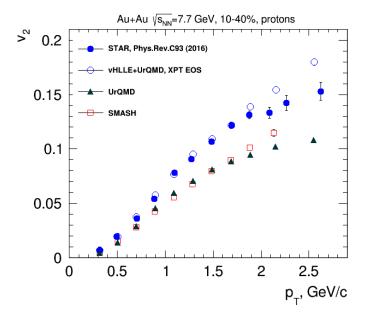

$$\frac{dN}{d\varphi} \sim 1 + \sum_{n=1} v_n \cos \left[ n \left( \varphi - \Psi_n \right) \right],$$

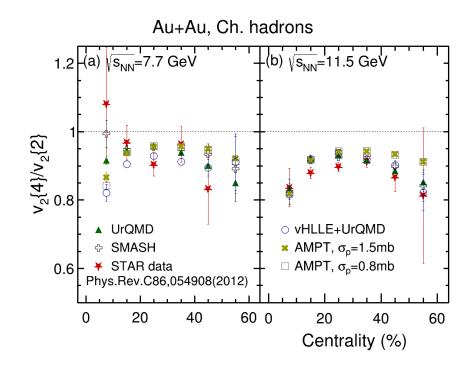

$$v_{2}\{2\} = \sqrt{\langle e^{i2(\phi_{1}-\phi_{2})}\rangle}, \quad v_{2}\{4\} = \sqrt[4]{\langle e^{i2(\phi_{1}+\phi_{2}-\phi_{3}-\phi_{4})}\rangle - 2\langle e^{i2(\phi_{1}-\phi_{2})}\rangle^{2}}$$

#### • $v_2$ is sensitive to the properties of strongly interacting matter:

 At √s<sub>NN</sub> ≥ 7.7 GeV pure string/hadronic cascade models underestimate v<sub>2</sub> – need hybrid models with QGP phase (vHLLE+UrQMD, AMPT SM)

- Relative v<sub>2</sub> fluctuations (v<sub>2</sub>{4}/v<sub>2</sub>{2}) observed by STAR experiment can be reproduced in the string/cascade models (UrQMD, SMASH) and hybrid model (AMPT SM, vHLLE+UrQMD)
- Dominant source of v<sub>2</sub> fluctuations: participant eccentricity fluctuations in the initial geometry

### The correlation coefficient

The correlation coefficient defined as

$$\rho(\mathbf{v}_2^2, [p_T]) = \frac{\operatorname{cov}(\mathbf{v}_2^2, [p_T])}{\sqrt{\operatorname{var}(\mathbf{v}_2^2)} \sqrt{c_k}}$$

where 
$$\operatorname{var}\left(\mathbf{v}_{2}^{2}\right)_{\operatorname{dyn}} = \left\langle \mathbf{v}_{2}^{4} \right\rangle - \left\langle \mathbf{v}_{2}^{2} \right\rangle^{2} = \left\langle \left\langle 4 \right\rangle \right\rangle \Big|_{A,C} - \left\langle \left\langle 2 \right\rangle \right\rangle^{2} \Big|_{A,C}$$

$$\langle\langle 2\rangle\rangle\Big|_{A,C} = \langle\langle e^{i\cdot 2(\varphi_1^A - \varphi_2^C)}\rangle\rangle = \frac{\mathbf{Q}_{2,A}\mathbf{Q}_{2,C}^*}{\mathbf{M}_A\mathbf{M}_C},$$

$$\left\langle \left\langle 4\right\rangle \right\rangle \Big|_{A,C} = \left\langle \left\langle e^{i\cdot 2\left(\varphi_{1}^{A} + \varphi_{2}^{A} - \varphi_{3}^{C} - \varphi_{4}^{C}\right)}\right\rangle \right\rangle = \frac{\left(\mathbf{Q}_{2,A}^{2} - \mathbf{Q}_{4,A}\right)\left(\mathbf{Q}_{2,C}^{2} - \mathbf{Q}_{4,C}\right)^{*}}{M_{A}\left(M_{A} - 1\right)M_{C}\left(M_{C} - 1\right)}$$

$$Q_{n,A/C} = \sum_{k} e^{i \cdot n \varphi_k^{A/C}}$$
 - flow vector for A/C sub event

 $M_{\scriptscriptstyle A/C}$  - multiplicity of particles

$$-1 < \eta < -0.35$$
  $|\eta| < 0.35$   $0.35 < \eta < 1$ 

A B C

to suppress non-flow effects, the two sub-events method was used

In the study were used charged particles with  $0.2 < p_{_T} < 2.0~{\rm GeV/c}$ 

### The correlation coefficient 2

The variance of the mean transvers momentum, taking into account autocorrelations, is defined as

$$c_{k} = \left\langle \frac{1}{M_{B}(M_{B}-1)} \sum_{B} \sum_{B' \neq B} \left( p_{T,B} - \left\langle \left[ p_{T} \right] \right\rangle \right) \left( p_{T,B'} - \left\langle \left[ p_{T} \right] \right\rangle \right) \right\rangle$$

where 
$$[p_T] = \sum_{i=1}^{M_B} p_{T,i} / M_B$$

to suppress non-flow and autocorrelation effects  $\text{in the } \operatorname{cov}(\mathbf{v}_2^2,[p_T]) \text{ the three-subevents method was used }$ 

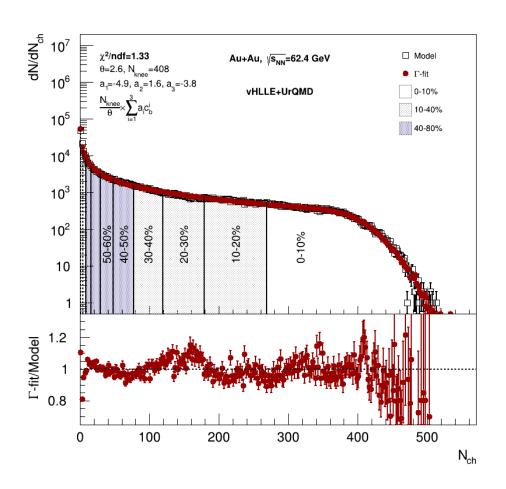

$$\operatorname{cov}\left(\mathbf{v}_{2}^{2}, \left[p_{T}\right]\right) = \left\langle \frac{\sum_{A,C} e^{i\cdot2\left(\varphi_{1}^{A}-\varphi_{2}^{C}\right)} \sum_{B} \left(p_{T,B} - \left\langle \left[p_{T}\right]\right\rangle\right)}{M_{A}M_{C}M_{B}} \right\rangle$$

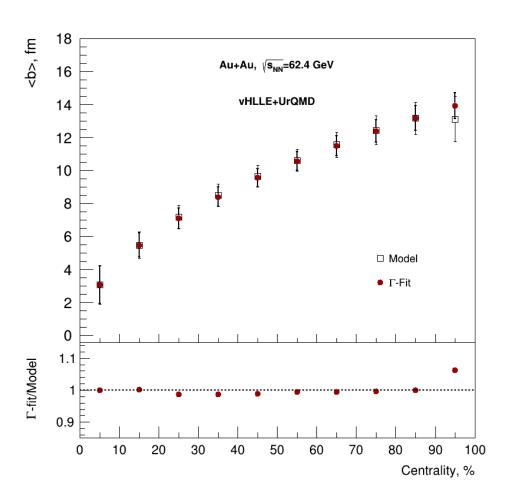

$$-1 < \eta < -0.35$$
  $|\eta| < 0.35$   $0.35 < \eta < 1$ 

### **Motivation of the work**

- $\triangleright$  The  $\rho(v_2^2, [p_T])$  is sensitive to initial state and its entropy density profile
- $\triangleright$  The  $\operatorname{cov}(\mathbf{v}_2^2,[p_T])$  and  $\operatorname{var}(\mathbf{v}_2^2)$  are sensitive to  $\eta/s$
- The precise set of measurements for  $var([p_T])$ ,  $var(v_2^2)$ ,  $cov(v_2^2, [p_T])$  and  $\rho(v_2^2, [p_T])$  as a function of beam-energy and centrality, could aid precision extraction of the temperature and baryon chemical-potential dependence of  $\eta/s$

# Centrality for Au+Au collisions at $\sqrt{S_{NN}}=62.4$ GeV in vHLLE+UrQMD

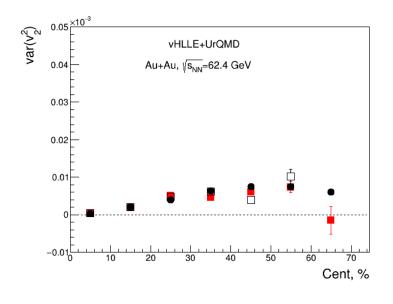

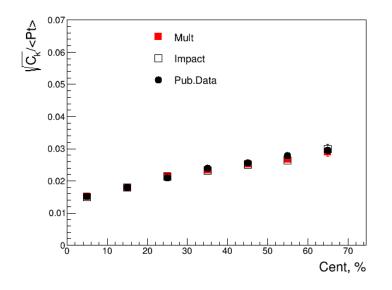

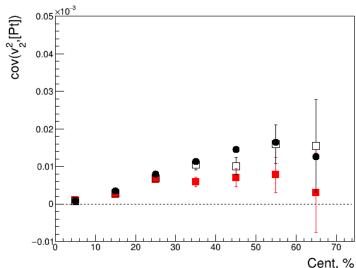

The reasonable fit quality and good agreement of the impact parameter distribution with the model data. For centrality determination the Inverse Bayes approach was used.

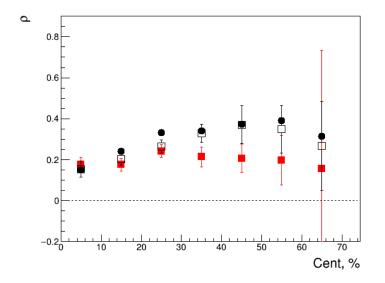

### Comparison of correlation coefficient with published results

The published data taken from: Niseem Magdy et. al. Published in: Phys.Rev.C 105 (2022) 4, 044901

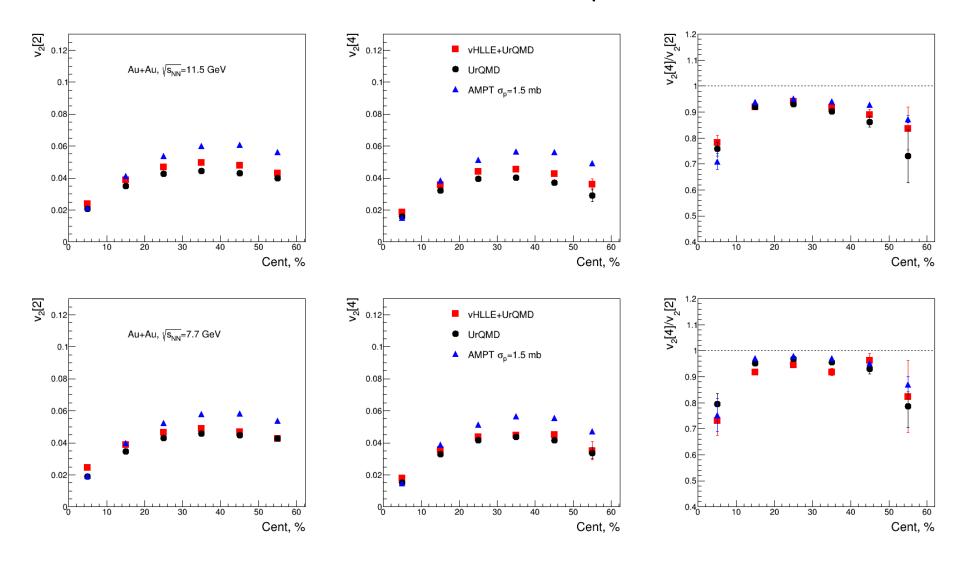

Filled red squares: multiplicity-based centrality

Open black squares: b-based centrality

- A good agreement between published data and results with b-based centrality
- The  $cov(v_2^2, [p_T])$  is sensitive to the multiplicity fluctuations

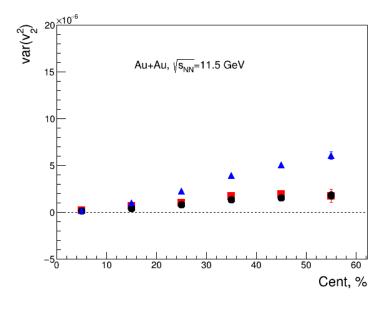

The  $cov(v_2^2, [p_T])$  and  $\rho(v_2^2, [p_T])$  depend on the centrality determination method.

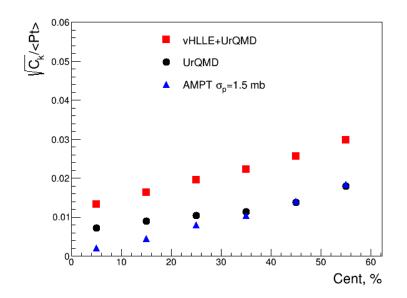

# Elliptic flow and its fluctuations at $\sqrt{S_{NN}}$ =7.7 and 11.5 GeV

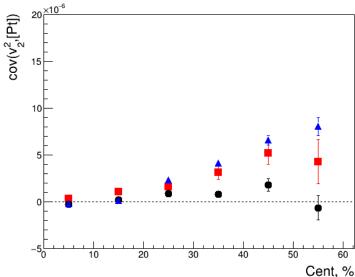

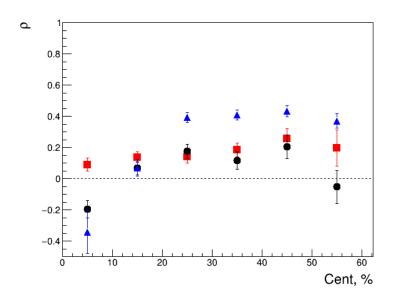

The flow fluctuations are model independent and decrease with decreasing energy.

# The transverse momentum-flow correlations at $\sqrt{S_{NN}}$ =11.5 GeV

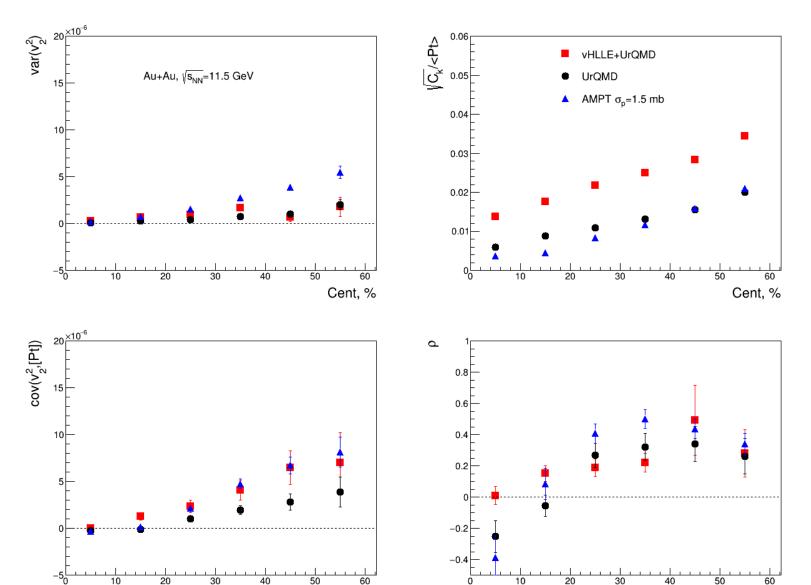

- $\rho(v_2^2, [p_T])$  decreases in the most central collisions due to the eccentricity decreases faster compared to changes in elliptic area.
- $ho(v_2^2,[p_T])$  from vHLLE+UrQMD and UrQMD are consistent with each other due to the same initial state
  - $\rho(v_2^2, [p_T])$  is sensitive to initial state
- $cov(v_2^2, [p_T])$  from vHLLE+UrQMD and AMPT are consistent due to QGP phase
  - $cov(v_2^2, [p_T])$  is sensitive to thermalization ( $\eta$ /s, etc.)

# The transverse momentum-flow correlations at $\sqrt{S_{NN}}$ =7.7 GeV

Cent, %

Cent, %

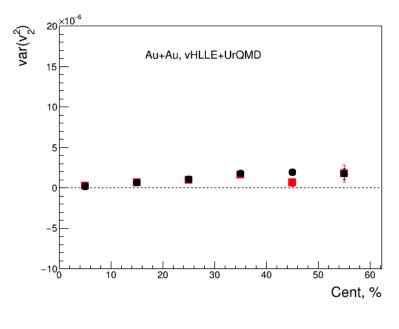

- The same trends as for  $\sqrt{S_{NN}}$ =11.5 GeV
- The var(v<sub>2</sub><sup>2</sup>) decrease with decreasing energy
- More statistics are needed to get more accurate results

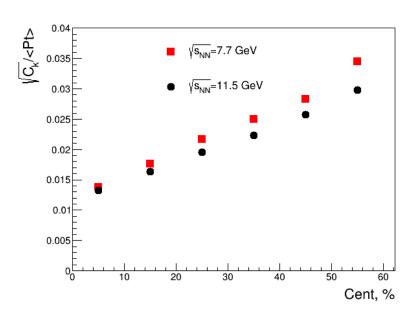

### **Summary and outlook**

- A good agreement between published data and results for vHLLE+UrQMD at  $\sqrt{S_{NN}}$  = 62.4 GeV with b-based centrality for  $\text{cov}(\mathbf{v}_2^2, [p_T])$  and  $\rho(\mathbf{v}_2^2, [p_T])$ 
  - The  $cov(v_2^2, [p_T])$  and  $\rho(v_2^2, [p_T])$  depend on the centrality determination method
- The results at  $\sqrt{S_{NN}}$ =7.7 and 11.5 GeV for AMPT, UrQMD, and vHLLE+UrQMD
  - $\rho(v_2^2, [p_T])$  from vHLLE+UrQMD and UrQMD are consistent with each other due to the same initial state
  - $cov(v_2^2, [p_T])$  from vHLLE+UrQMD and AMPT are consistent due to QGP phase simulation
  - $\rho(v_2^2, [p_T])$  decreases in the most central collisions
  - for the first time, results were obtained at  $\sqrt{S_{NN}}$ =7.7 and 11.5 GeV
- Investigate beam-energy and event-shape dependence of the  ${
  m v}_2^2-[p_T]$  correlation using vHLLE+UrQMD model
- Study sensitivity of  $v_2^2 [p_T]$  correlation to different equation of states in models within mean-field approach at lower beam energies

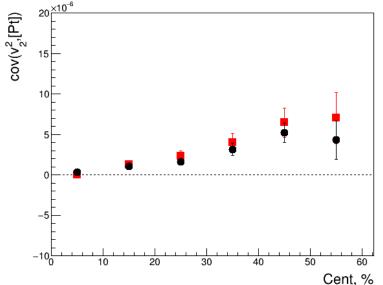

# Thank you for your attention!

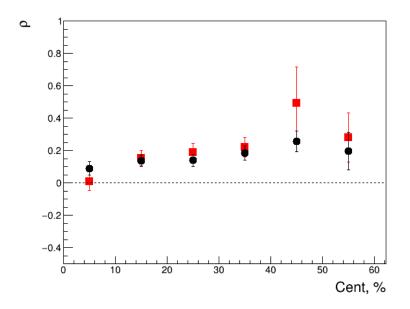

# The results for vHLLE+UrQMD at $\sqrt{S_{NN}}$ =7.7 and 11.5 GeV

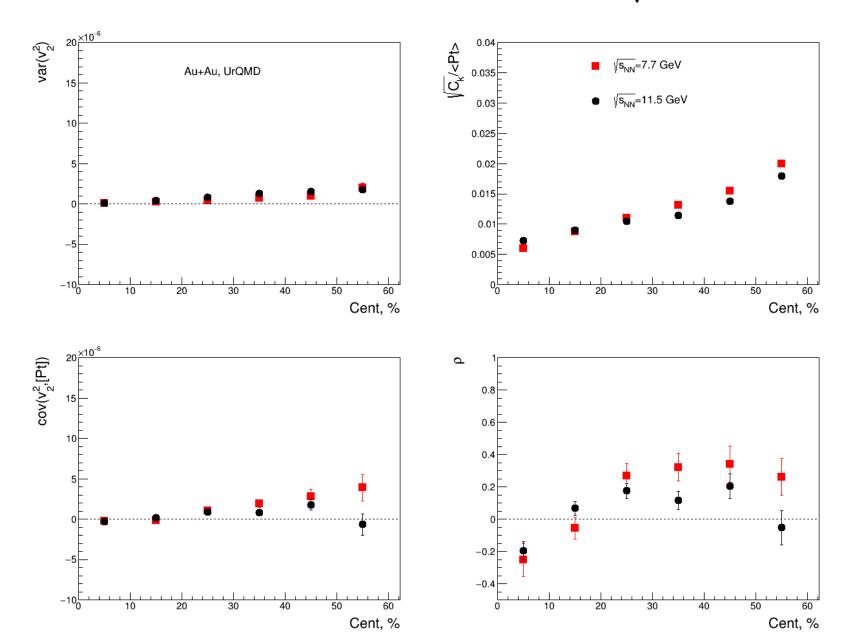

- The  $\text{cov}(\mathbf{v}_2^2,[p_T])$  and  $\rho(\mathbf{v}_2^2,[p_T]) \text{ changes weakly at}$   $\sqrt{S_{NN}} = 7.7 \text{ and } 11.5 \text{ GeV}$
- The  $\sqrt{c_k}/\langle p_T \rangle$  increases with decreasing energy.

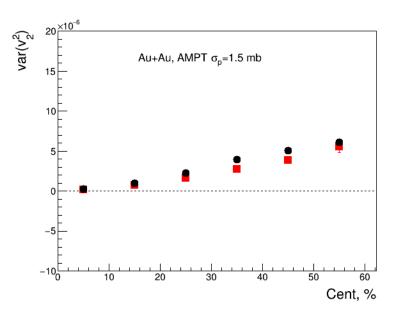

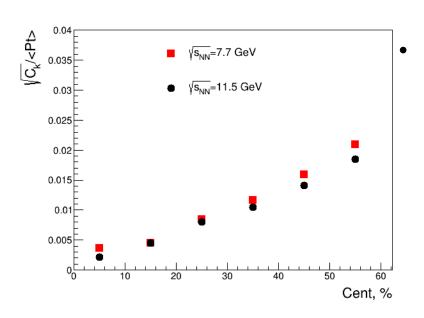

# The results for UrQMD at $\sqrt{S_{NN}}$ =7.7 and 11.5 GeV

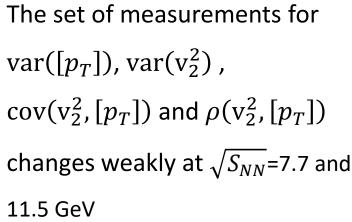

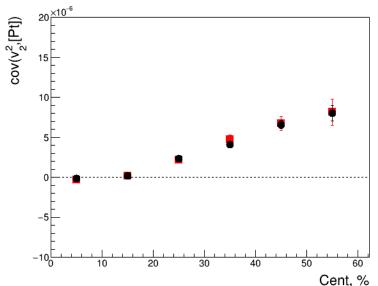

• Do the  $cov(v_2^2, [p_T])$  and  $\rho(v_2^2, [p_T])$  increases with decreasing energy due to non-flow effects?

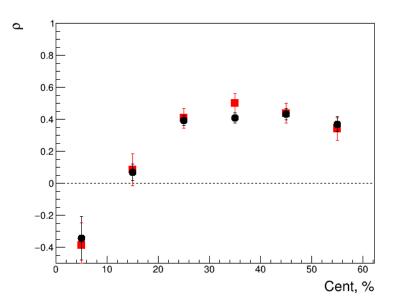

### The results for AMPT at $\sqrt{S_{NN}}$ =7.7 and 11.5 GeV

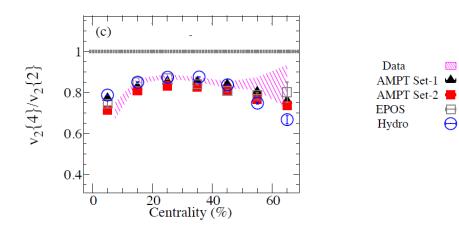

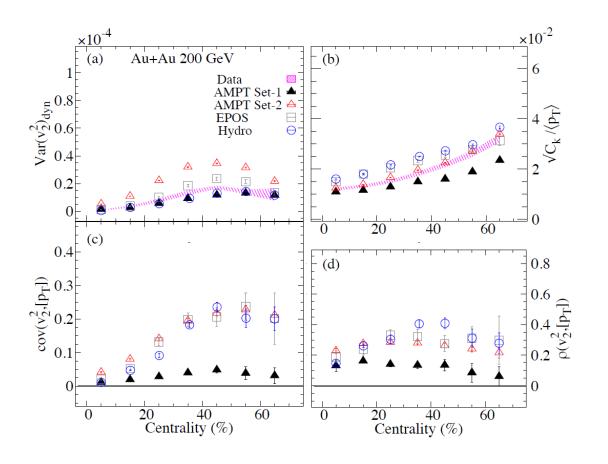

### **Summary and outlook**

- A good agreement between published data and results for vHLLE+UrQMD at  $\sqrt{S_{NN}}$  = 62.4 GeV with b-based centrality for  $cov(v_2^2, [p_T])$  and  $\rho(v_2^2, [p_T])$ 
  - The  $cov(v_2^2, [p_T])$  and  $\rho(v_2^2, [p_T])$  depend on the centrality determination method
- The results at  $\sqrt{S_{NN}}$ =7.7 and 11.5 GeV for AMPT, UrQMD, and vHLLE+UrQMD
  - The  $\rho(v_2^2, [p_T])$  vs. centrality for vHLLE+UrQMD at  $\sqrt{S_{NN}}$ =7.7 and 11.5 shows the similar trends as for BES energies.
  - $\rho(v_2^2, [p_T])$ <0 for the most central collisions in UrQMD and AMPT models at  $\sqrt{S_{NN}}$ =7.7 and 11.5 GeV
- Investigate beam-energy and event-shape dependence of the  ${
  m v}_3^2-[p_T]$  correlation using vHLLE+UrQMD model
- Study sensitivity of  ${\bf v}_2^2-[p_T]$  correlation to different equation of states in models within mean-field approach at lower beam energies

### **Transverse momentum-flow correlations**

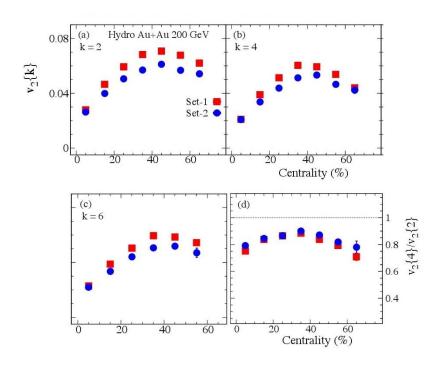

Models	Initial stage conditions	η/s
AMPT	Glauber-like & SM-ON	0.10
AMPT	Glauber-like & SM-OFF	0.10
EPOS	Described in terms of flux tubes computed based on Gribov-Regge multiple scattering theory	0.08
Hydro	Woods-Saxon distributions Glauber-like Initial conditions	(BES)

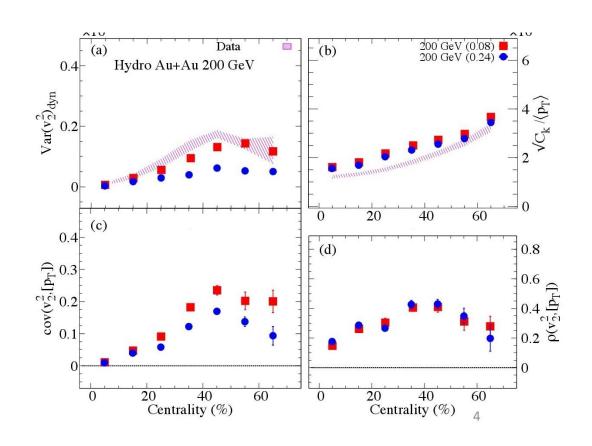

- ightharpoonup The  $cov(v_2^2, [p_T])$  and  $\rho(v_2^2, [p_T])$  show agreement between AMPT (SM) and EPOS
- Smaller  $cov(v_2^2, [p_T])$  and  $\rho(v_2^2, [p_T])$ , from AMPT without SM

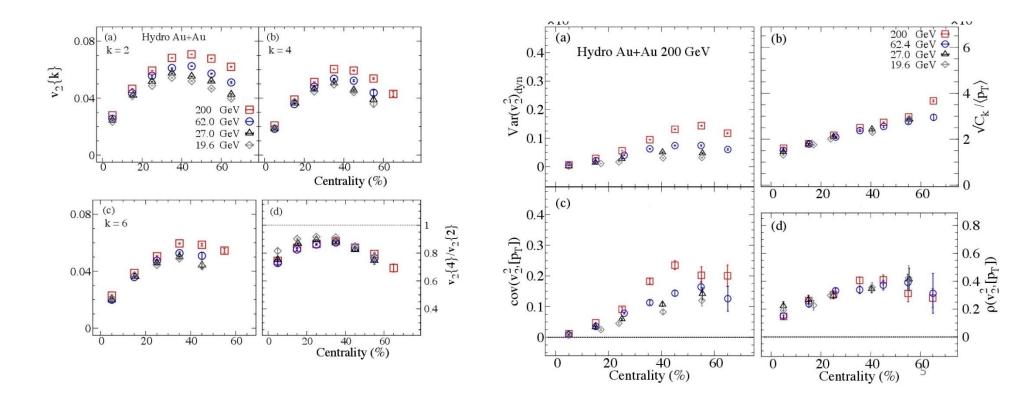

### **Transverse momentum-flow correlations**

- ightharpoonup The  $cov(v_2^2, [p_T])$  decreas with  $\eta/s$
- ightharpoonup The  $\rho(v_2^2, [p_T])$ , show weak dependance on  $\eta/s$

# The transverse momentum-flow correlations dependence on beam energy in vHLLE+UrQMD model

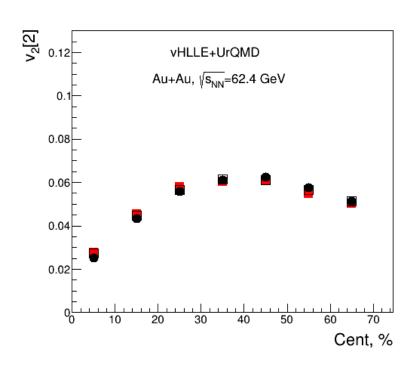

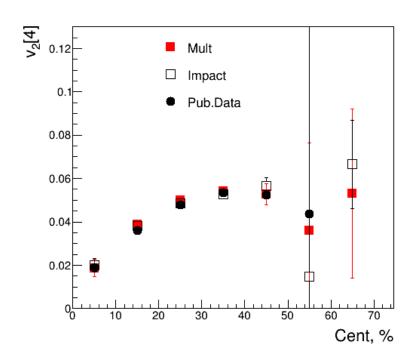

- ightharpoonup The  $cov(v_2^2, [p_T])$  decreas with beam energy
- $\triangleright$  The  $\rho(v_2^2, [p_T])$ , show weak dependance on beam energy

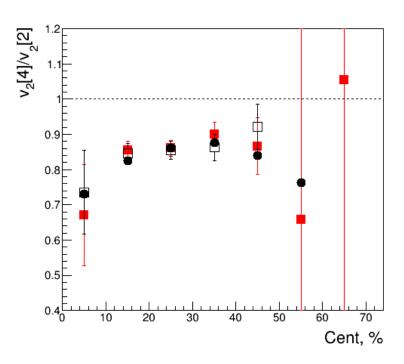

### Comparison of elliptic flow measurements with published results

Filled red squares: multiplicity-based centrality

Open black squares: impact parameter (b) based centrality

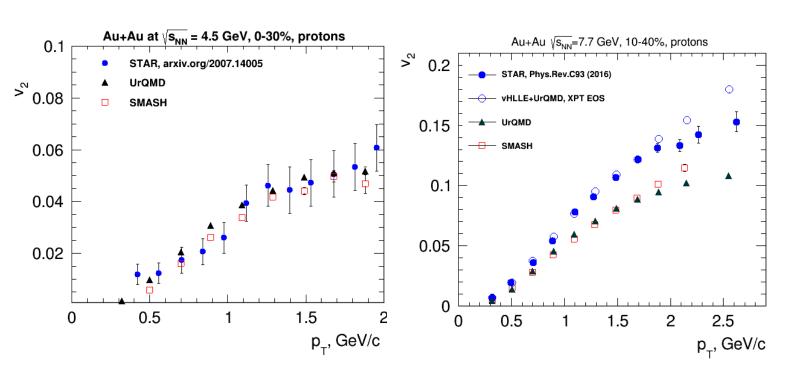

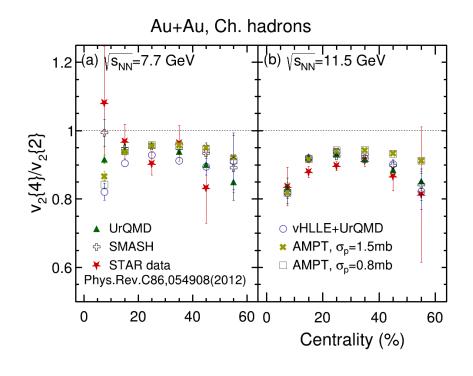

A good agreement with published data.  $v_2[2]$  and  $v_2[4]$  are insensitive to centrality determination method.

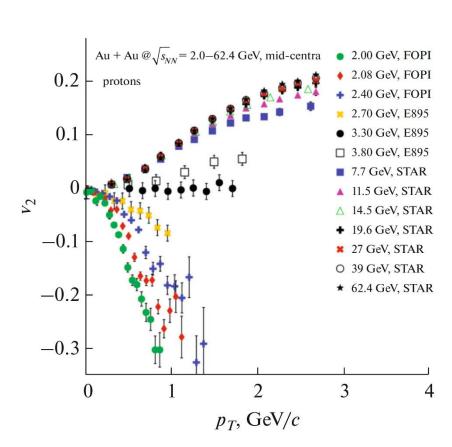

### **Elliptic flow at NICA energies**

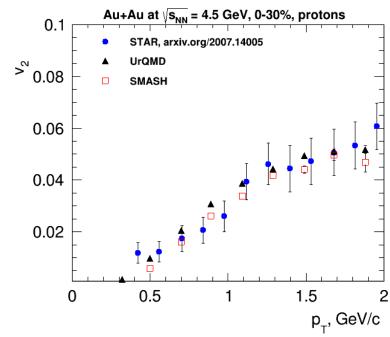

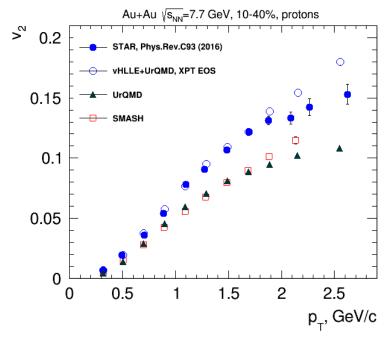

- v<sub>2</sub> is sensitive to the properties of strongly interacting matter:
  - At  $\sqrt{s_{NN}} = 4.5$  GeV pure string/hadronic cascade models (UrQMD, SMASH,...) give similar  $v_2$  signal compared to STAR data
  - At  $\sqrt{s_{NN}} \ge 7.7$  GeV pure string/hadronic cascade models underestimate  $v_2$  need hybrid models with QGP phase (vHLLE+UrQMD, AMPT with string melting,...)
- Relative v<sub>2</sub> fluctuations (v<sub>2</sub>{4}/v<sub>2</sub>{2}) observed by STAR experiment can be reproduced both in the string/cascade models (UrQMD, SMASH) and hybrid model (AMPT SM, vHLLE+UrQMD)
- Dominant source of v<sub>2</sub> fluctuations: participant eccentricity fluctuations in the initial geometry

### **Elliptic flow at NICA energies**

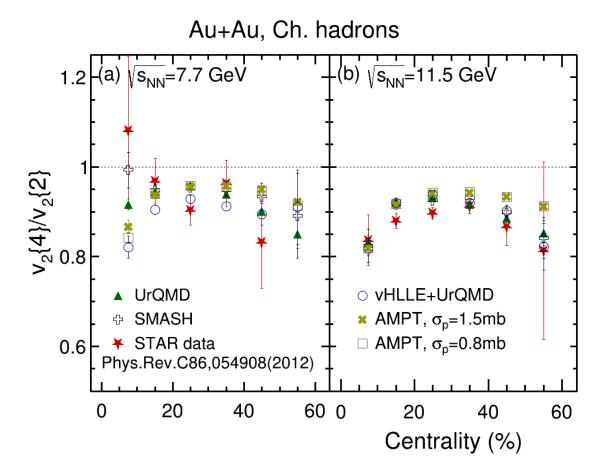

Taranenko et. al., Phys. Part. Nuclei **51**, 309–313 (2020)

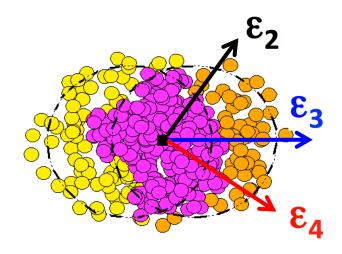

- Strong energy dependence of v2 at  $\sqrt{s_{NN}}$  = 3-11 GeV
  - $v_2$ ≈0 at  $\sqrt{s_{NN}}$  = 3.3 GeV and negative below
- Lack of differential measurements of v<sub>2</sub> at NICA energies (p<sub>T</sub>, centrality, PID,...)
- v<sub>2</sub> is sensitive to the properties of strongly interacting matter:
  - At  $\sqrt{s_{NN}}$  = 4.5 GeV pure string/hadronic cascade models (UrQMD, SMASH,...) give similar v<sub>2</sub> signal compared to STAR data
  - At  $\sqrt{s_{NN}} \ge 7.7$  GeV pure string/hadronic cascade models underestimate  $v_2$  need hybrid models with QGP phase (vHLLE+UrQMD, AMPT with string melting,...)

### Relative elliptic flow fluctuations

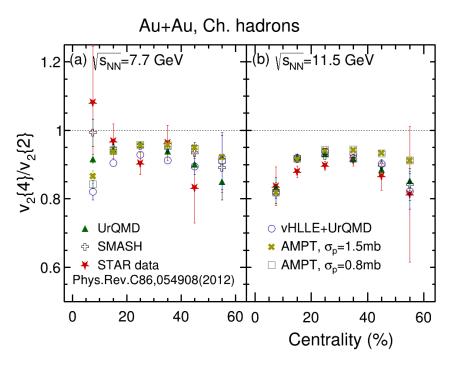

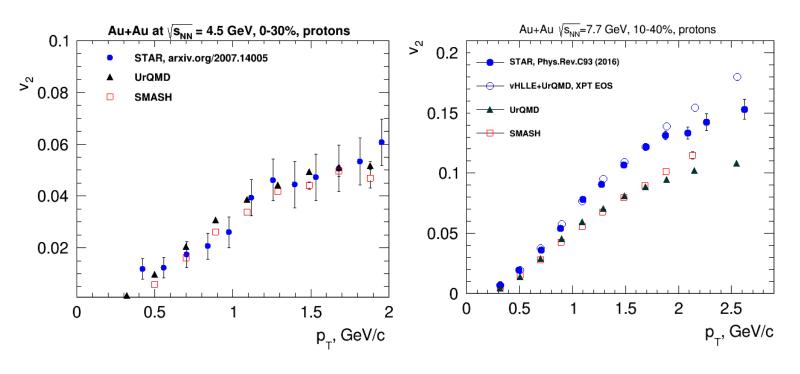

Small value for the  $v_2{4}/v_2{2}$  ratio corresponds to large fluctuation

- Relative v<sub>2</sub> fluctuations (v<sub>2</sub>{4}/v<sub>2</sub>{2}) observed by STAR experiment can be reproduced both in the string/cascade models (UrQMD, SMASH) and hybrid model (AMPT with string melting, vHLLE+UrQMD)
- Dominant source of v<sub>2</sub> fluctuations: participant
   eccentricity fluctuations in the initial geometry

### **Elliptic flow at NICA energies**

- Relative v<sub>2</sub> fluctuations (v<sub>2</sub>{4}/v<sub>2</sub>{2}) observed by STAR experiment can be reproduced both in the string/cascade models (UrQMD, SMASH) and hybrid model (AMPT SM, vHLLE+UrQMD)
- Dominant source of v<sub>2</sub> fluctuations: participant eccentricity fluctuations in the initial geometry

- v<sub>2</sub> is sensitive to the properties of strongly interacting matter:
  - At  $\sqrt{s_{NN}}$  = 4.5 GeV pure string/hadronic cascade models (UrQMD, SMASH,...) give similar v<sub>2</sub> signal compared to STAR data
  - At  $\sqrt{s_{NN}} \ge 7.7$  GeV pure string/hadronic cascade models underestimate  $v_2$  need hybrid models with QGP phase (vHLLE+UrQMD, AMPT with string melting,...)
