Radiowave detection of neutrinos

Friday, 9 October 2020 16:00 (30)

I'll present a summary of techniques used to measure ultra-high energy neutrinos by both ice-based and mid-latitude experiments. I'll also give comments on multi-messenger aspects of these physics programs, and attempt to outline plans for the next-generation radio neutrino experiment (IceCube Gen-2 radio) planned to begin construction at South Pole in 2025.
