The 5th international conference on particle physics and astrophysics

Contribution ID : 798

Type : Oral talk

Interactive, F(R) and other cosmological models, recent observational data and H_0 tension

Thursday, 8 October 2020 18:55 (20)

Different cosmological scenarios are confronted with recent observational data, in particular, models with interaction of the dark components which are interpreted as scalar field with common potential, two models with bulk viscosity combined with power-law and logarithmic equations of states, F(R) models and other scenarios. The mentioned observations include the Pantheon catalog of Type Ia supernovae, the latest measurements of the Hubble parameter H(z) (cosmic chronometers), data from baryon acoustic oscillations and cosmic microwave background radiation. For these observations and some models we investigate possibilities to alleviate the Hubble constant tension problem.
