## **Development of V0-finder for the MPD experiment based on the Kalman filter method**

Strangeness production in relativistic heavy ion collisions is a signature and a diagnostic tool of quark–gluon plasma (QGP) formation and properties. This is the one of the central topic of the physics program of Multi-Purpose Detector (MPD) at collider NICA. In this work a formalism based on the Kalman filter method for reconstruction of two-particle decays in the MPD experiment will be presented and discussed.
