Search for a high-mass Higgs boson decaying to a pair of W bosons in pp collisions at 13 TeV with the ATLAS detector

Monday, 10 October 2016 15:15 (30)

In this poster a search for a high-mass Higgs boson in the H–>WW–>lvlv decay channel is presented. The search is using pp collision data corresponding to an integrated luminosity of 13.2 fb-1 collected at a centre-of-mass energy of 13 TeV by the ATLAS detector at the Large Hadron Collider. No evidence of a high-mass Higgs boson is found. Upper limits on HxBR(H–>WW) as a function of the Higgs boson mass and width are obtained in the mass range between 300 GeV and 3 TeV.
