

Multiband observations of the Crab Nebula

Tuesday, 11 October 2016 13:30 (15)

The results of simultaneous imaging of the Crab Nebula in the radio (JVLA), optical (HST ACS and WFC3), and X-ray (Chandra) bands are presented. The images show a variety of small-scale emitting structures, including wisps mainly located to the north-west of the pulsar and knots forming a ring-like structure usually associated with the termination shock of the pulsar wind.

Primary author(s) : Dr. KRASSILCHTCHIKOV, Alexander (A.F. Ioffe Institute for Physics and Technology)

Co-author(s) : Prof. BYKOV, Andrei (Ioffe Institute); Prof. PAVLOV, George (Pennsylvania State University); Dr. DUBNER, Gloria (Instituto de Astronomia y Fisica del Espacio, Buenos Aires); Dr. KARGALTSEV, Oleg (The George Washington University, Washington)

Presenter(s) : Dr. KRASSILCHTCHIKOV, Alexander (A.F. Ioffe Institute for Physics and Technology)

Session Classification : Cosmic rays - parallel II

Track Classification : Cosmic rays
