

Formation of ${}^3,4\text{He}$ in the reaction of stopped pion absorption

Chernyshev B. A., Gurov Yu. B., Korotkova L. Yu.,
Lapushkin S. V., Leonova T. I., Pritula R. V., Shchurenkova T.D.

Practical significance:

- cumulative processes accompanying nuclear reactions at low and intermediate energies (100 MeV - 1 GeV).

Reaction:

- π^- is captured by the Coulomb field of the nucleus of the target;
- π^- is absorbed by the nucleus:
 - ✓ pion is absorbed by an intranuclear cluster;
 - ✓ a pre-equilibrium stage;
 - ✓ an evaporation stage;

Purpose of the work:

- to describe the spectra of ${}^{3,4}\text{He}$ formed in the stopped pion absorption reaction:

- to evaluate contribution of different mechanisms to yields on the different stages of the reaction;
- to describe the yields of ${}^3\text{He}$ formed through the pick-up mechanism.

Experiment

- absolute error – 7%,
relative error – 3,5%;
- 17 targets were studied;
- energy resolution – 0,6 MeV;
- measurements were carried out up to the kinematic limits of the reaction.

${}^6,7\text{Li}$, ${}^9\text{Be}$, ${}^{10,11}\text{B}$, ${}^{12}\text{C}$, ${}^{28}\text{Si}$, ${}^{40}\text{Ca}$,
 ${}^{59}\text{Co}$, ${}^{93}\text{Nb}$, ${}^{114,117,120,124}\text{Sn}$, ${}^{169}\text{Tm}$,
 ${}^{181}\text{Ta}$, ${}^{209}\text{Bi}$.

Experimental results

Simulation of knock-out mechanism

Simulation of knock-out mechanism

${}^{117}\text{Sn}$

- - experiment
- - simulation of knock-out

Description of the difference

${}^{117}\text{Sn}$

- - difference
- - description

$T = 14.8 \pm 0.1 \text{ MeV}$

$T = 8.4 \pm 0.3 \text{ MeV}$

Simulation of pick-up mechanism

- $\pi^- + (pp) \rightarrow p + n$; $p + d \rightarrow {}^3\text{He}$
- $d + d \rightarrow {}^4\text{He}$
- spectrum of primary p was used

Simulation of pick-up mechanism

$dY/dE * 10^{-3}, {}^3\text{He}/(\text{MeV} * \text{stop. } \pi^-)$

${}^3\text{He}$

${}^{117}\text{Sn}$

- - experiment
- - simulation of pick-up

$dY/dE * 10^{-3}, {}^4\text{He}/(\text{MeV} * \text{stop. } \pi^-)$

${}^4\text{He}$

A-dependence of the yields of ^3He

● - experimental yields, ■ - yields from knock-out and pick-up

Description of ^3He pick-up yields

- - pick-up yields, ■ - description

$$Y = C * P_{pp} \cdot P_{pick-up} \cdot P_{^3\text{He}}$$

$$P_{pp} = \frac{Z-1}{Z-1+2 \cdot R'N}$$

$$P_{pick-up} = \left(\frac{Z}{N}\right)^{2.1}$$

$$P_{^3\text{He}} = \exp(-\beta \cdot A^{1/6})$$

Conclusions:

- the model allows satisfactorily reproduce the spectra of ${}^3,4\text{He}$ at energies >30 MeV;
- the contribution of the knock-out process into the formation of ${}^3\text{He}$ is $\sim 10\%$ of the total yield, ${}^4\text{He}$ is $\sim 5\%$;
- the contribution of the pick-up process into the formation of ${}^3\text{He}$ is $\sim 60\%$ of the total yield, ${}^4\text{He}$ is $\sim 40\%$;
- the analytical dependence for describing the pick-up yields of ${}^3\text{He}$ has been obtained.

Thank You for attention!
