Mathematical modeling of the radiation environment sensor based on diamond detectors

Thursday, 13 October 2016 15:15 (30)

The physical and mathematical model of the radiation situation in the diamond sensor detector was developed. Count rates of the particle sensors were measured in the registration of a monoenergetic electron and proton radiation. The simulation of the sensor data was made for simultaneously iradiation by electrons and protons with spectral characteristics, that were corresponded to cosmic spectra. It is shown that structure of data, that were measured with sensors, let effectively separate signals from electronic and proton cosmic radiation component.

Primary author(s) : Mr. GLADCHENKOV, Evgeny (Industrial - Technology Center "UralAlmazInvest", Ivano-Franko street, Moscow, 121108, Russia); Mr. TYURIN, Evgeny (National Research Nuclear University "MEPhI"); Mr. ZAHARCHENKO, Kirill (Industrial - Technology Center "UralAlmazInvest", Ivano-Franko street, Moscow, 121108, Russia); Mr. NEDOSEKIN, Pavel (Industrial - Technology Center "UralAlmazInvest", Ivano-Franko street, Moscow, 121108, Russia); Mr. IBRAGIMOV, Renat (National Research Nuclear University MEPhI (Moscow Engineering Physics Institute)); Mr. KOLYUBIN, Vladimir (Industrial - Technology Center "UralAlmazInvest", Ivano-Franko street, Moscow, 121108, Russia)

Presenter(s) : Mr. ZAHARCHENKO, Kirill (Industrial - Technology Center "UralAlmazInvest", Ivano-Franko street, Moscow, 121108, Russia)

Session Classification : Poster session - IV

Track Classification : Methods of experimental physics
