## Calculation of the electronic structure in the field of a homogeneously charged core of a large radius.

Tuesday, 11 October 2016 15:15 (30)

Calculation of the electronic wavefunctions and energies in the field of a homogeneously charged core of a large radius are reviewed. The Hartree-Fock self-consistent field method is applied for the problem. The model of large core is used for modeling small metal particles. Also the density-functional method is used in conjunction with the Hartree-Fock method. Results are compared with other authors.
