## Measuring Muon-Induced Fast Neutrons at the Baksan Underground Scintillation Telescope

Wednesday, 12 October 2016 17:45 (15)

An estimation of the fast neutron flux in an underground laboratory excavated under about 320 m of rock has been performed on a data set acquired during the 2001-2015 years. A neutron background measurement relies on the production of a cosmogenic nuclide  ${}^{12}B$  by fast neutrons in an organic scintillator. The estimated full fluxes of neutrons agree with results of Monte-Carlo simulation.
