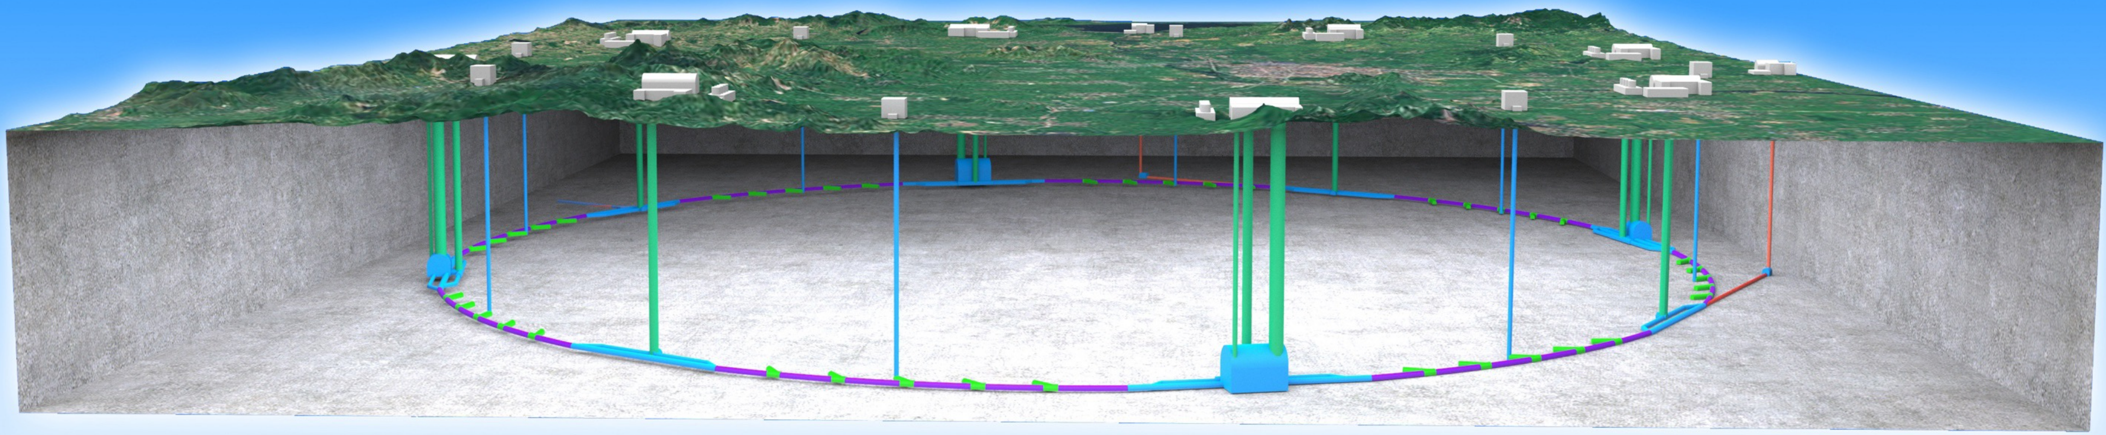
Circular Electron Positron Collider: Science & Status

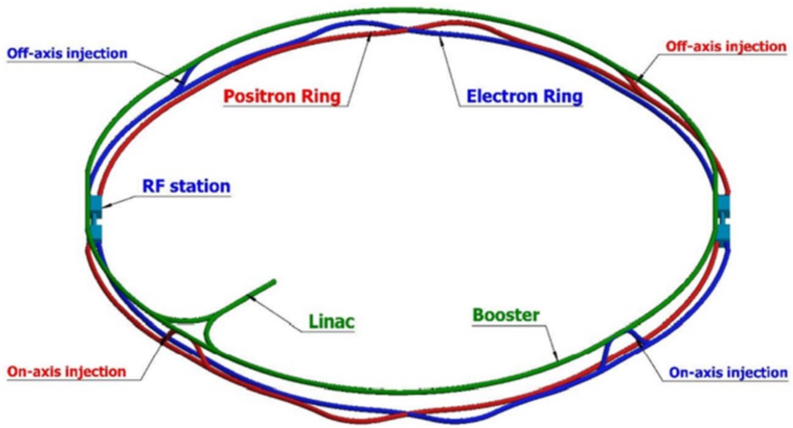


Manqi RUAN(IHEP, Beijing)

A brief introduction to CEPC

- CEPC: an e^+e^- Higgs factory producing H and W/ Z bosons and top quarks
  aims at discovering new physics beyond the Standard Model
  - CEPC + SppC complex proposed in 2012 right after the Higgs discovery
  - Conceptual Design Report delivered in Nov. 2018, 1st for circular ee Higgs factory
  - R&D reaching maturity, accelerator TDR published at 2023, high-impact innovations

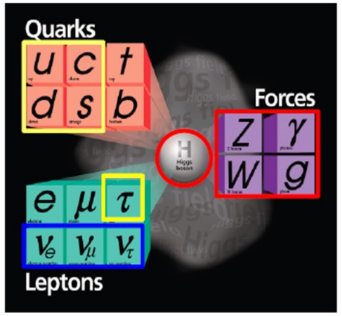
- Proposed to commence the construction in ~2026
  to deliver Higgs data in 2030s

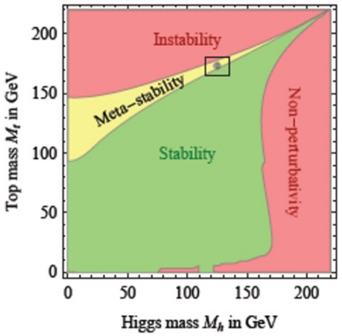


CEPC circumference ~ 100km

Scientific objectives, significance, and strategic value

- We have a very successful Standard Model
- But we still have a lot of issues and questions:
  - Anything fundamentals behind the flavor symmetry ?
  - Mass hierarchy of elementary particles normal ?
  - Fine tuning of Higgs mass natural ?
  - Why a meta-stable vacuum ?
  - What are dark matter particles ?
  - No CP in the SM to explain Matter-antimatter asymmetry
  - Dirac or Majorana Neutrino mass ?
  - Unification of interactions at a high energy ?
- We are at a turning point:
  - a new, much deeper theory ?
  - Choices of experimental approaches ?
    - e^+e^-, pp, ep, $\mu^+\mu^-$ or no machine ?





- "Small cost" to look for hints. If yes, go for direct searches

$$\mathcal{L} = \mathcal{L}_{SM} + \sum_i \frac{c_i}{M^2}\mathcal{O}_{6,i} \qquad \delta \sim c_i \frac{v^2}{M^2}$$

No signal at LHC:

Direct searches: M ~ 1 TeV

10% precision: M ~ 1 TeV

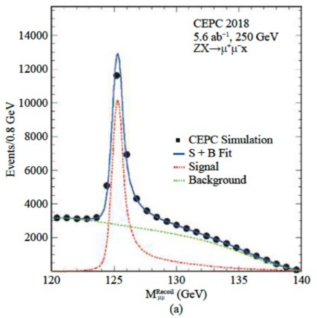
Look for signals at CEPC/FCC-ee:

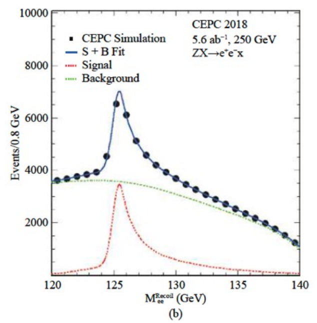
Precisions exceed HL-LHC ~ 1 order of magnitude (1% precision) ➔ M ~10 TeV

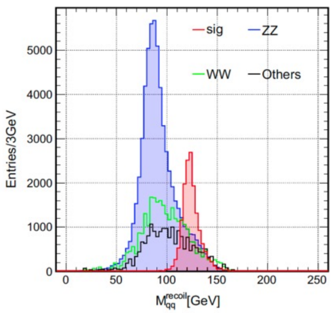
Naturalness will be at ~10^{-4} up to 10 TeV
If no New Physics up to 10 TeV, there will be no naturalness ➔ even bigger discovery ?

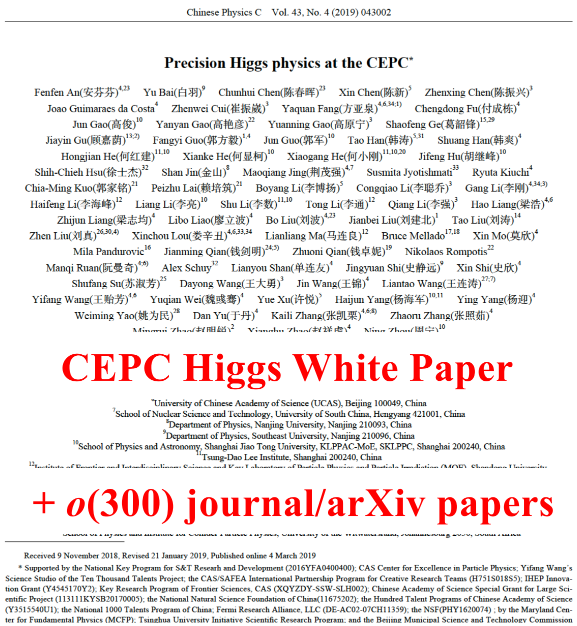
Pressing science questions, best addressed by an e^+e^- Higgs factory (~1% precision)

Scientific objectives, significance, and strategic value









Chinese Physics C Vol. 43, No. 4 (2019) 043002

Precision Higgs physics at the CEPC*

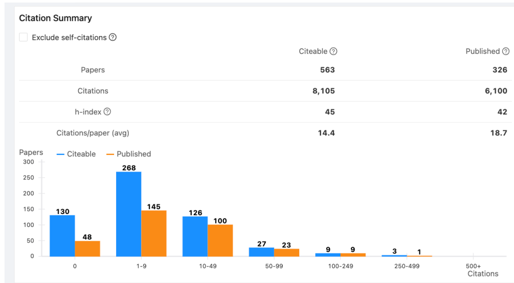
Received 9 November 2018, Revised 21 January 2019, Published online 4 March 2019

Table 2.1: Precision of the main parameters of interests and observables at the CEPC, from Ref. [1] and the references therein, where the results of Higgs are estimated with a data sample of 20 ab^{-1}. The HL-LHC projections of 3000 fb^{-1} data are used for comparison. [2]

Higgs			W, Z and top		
Observable	HL-LHC projections	CEPC precision	Observable	Current precision	CEPC precision
M_H	20 MeV	3 MeV	M_W	9 MeV	0.5 MeV
Γ_H	20%	1.7%	Γ_W	49 MeV	2 MeV
$\sigma(ZH)$	4.2%	0.26%	M_{top}	760 MeV	$\mathcal{O}(10)$ MeV
$B(H \to bb)$	4.4%	0.14%	M_Z	2.1 MeV	0.1 MeV
$B(H \to cc)$	-	2.0%	Γ_Z	2.3 MeV	0.025 MeV
$B(H \to gg)$	-	0.81%	R_b	3×10^{-3}	2×10^{-4}
$B(H \to WW^*)$	2.8%	0.53%	R_c	1.7×10^{-2}	1×10^{-3}
$B(H \to ZZ^*)$	2.9%	4.2%	R_μ	2×10^{-3}	1×10^{-4}
$B(H \to \tau^+\tau^-)$	2.9%	0.42%	R_τ	1.7×10^{-2}	1×10^{-4}
$B(H \to \gamma\gamma)$	2.6%	3.0%	A_μ	1.5×10^{-2}	3.5×10^{-5}
$B(H \to \mu^+\mu^-)$	8.2%	6.4%	A_τ	4.3×10^{-3}	7×10^{-5}
$B(H \to Z\gamma)$	20%	8.5%	A_b	2×10^{-2}	2×10^{-4}
Bupper$(H \to \text{inv.})$	2.5%	0.07%	N_ν	2.5×10^{-3}	2×10^{-4}

Scientific Significance quantified by **CEPC physics** studies, via full simulation/phenomenology studies:

- Higgs: Precisions exceed HL-LHC ~ 1 order of magnitude.
- EW: Precision improved from current limit by 1-2 orders.
- Flavor Physics, sensitive to NP of 10 TeV or even higher.
- Sensitive to varies of NP signal.
- …



Scientific objectives, significance, and strategic value

Energy Scale
to be explored

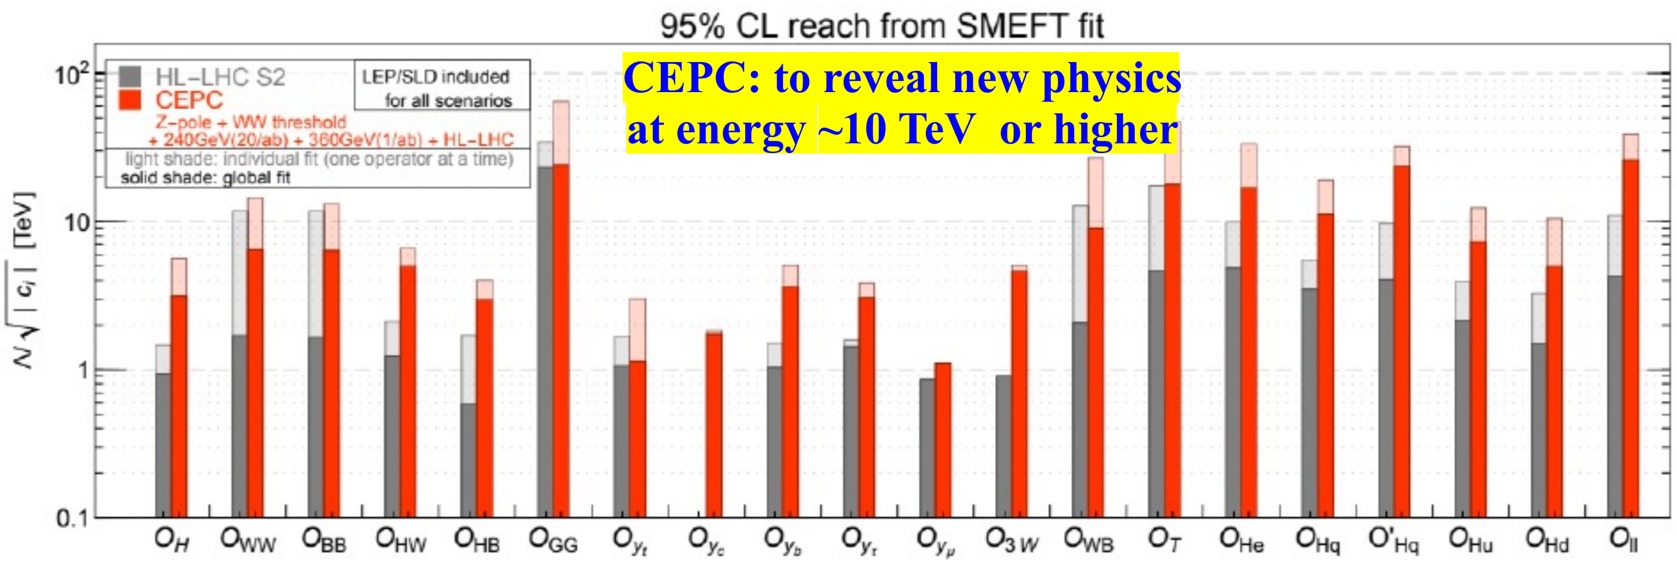


Figure 2.1: Covered energy scales of new physics from CPEC and HL-LHC, based on measurements of operators in the framework of the Standard Model Effective Field Theory (SMEFT). [1]

CEPC targets a major breakthrough in basic research, will greatly expand our understanding of the world.

Scientific objectives, significance, and strategic value

The scientific importance and strategical value of an electron positron Higgs factory is clearly identified.

clear consensus in HEP community

2013, 2016: ***the CEPC is the best approach*** *and a major historical opportunity for the national development of accelerator-based high-energy physics program.*

An electron-positron Higgs factory is the highest-priority next collider. For the longer term, the European particle physics community has the ambition to operate a proton-proton collider at the highest achievable energy. Accomplishing these compelling goals will require innovation and cutting-edge technology:

Pathways to Innovation and Discovery in Particle Physics

Report of the Particle Physics Project Prioritization Panel 2023

Recommendation 6

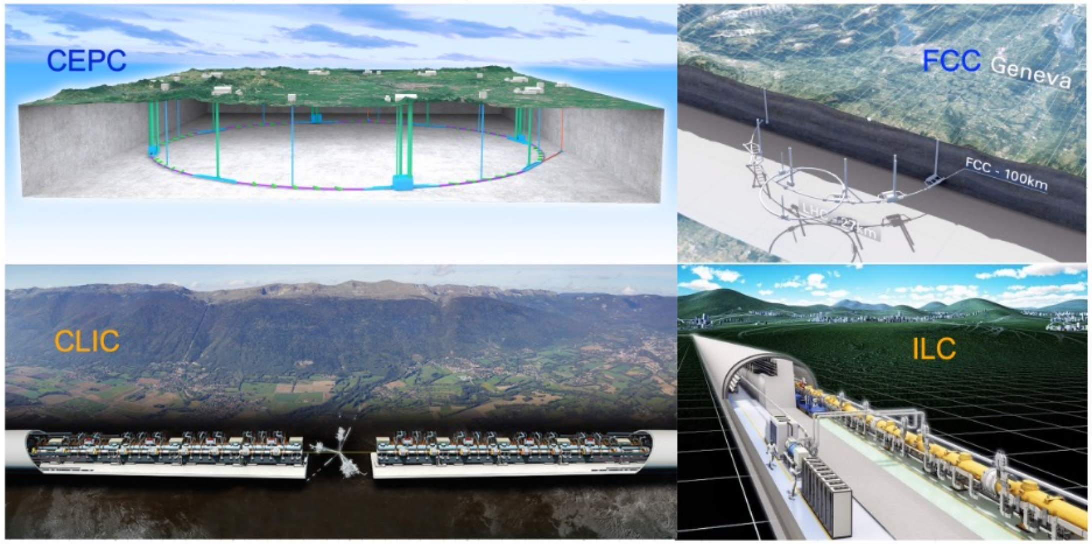
Convene a targeted panel with broad membership across particle physics later this decade that makes decisions on the US accelerator-based program at the time when major decisions concerning an off-shore Higgs factory are expected, and/or significant adjustments within the accelerator-based R&D portfolio are likely to be needed. A plan for the Fermilab accelerator complex consistent with the long-term vision in this report should also be reviewed.

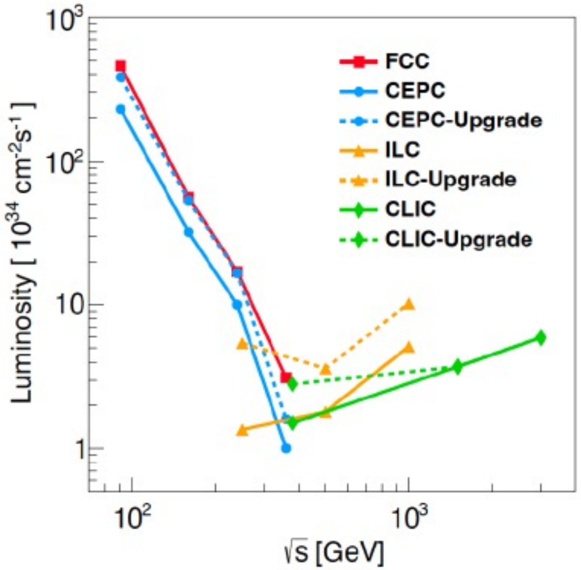
The panel would consider the following:

1. The level and nature of **US contribution in a specific Higgs factory** including an evaluation of the associated schedule, budget, and risks once crucial information becomes available.
2. Mid- and large-scale **test and demonstrator facilities** in the accelerator and collider R&D portfolios.
3. A plan for the evolution of the **Fermilab accelerator complex** consistent with the longterm vision in this report, which may commence construction in the event of a more favorable budget situation.

In April 2022, the International Committee for Future Accelerators (ICFA) "reconfirmed the international consensus on the importance of ***a Higgs factory as the highest priority for realizing the scientific goals of particle physics****", and expressed support for the above-mentioned Higgs factory proposals. Recently, the United States also proposed a new linear collider concept based on the cool copper collider (C3) technology [31].*

International competition & Comparative advantages





- Electron-positron Higgs factories identified as top priority for future collider (ESPPU).
- CEPC has strong advantages among mature electron-positron Higgs factories (design report delivered),
  - **Earlier data**: collision expected in 2030s (vs. FCC-ee ~ 2040s), **larger tunnel cross section** （ee, pp coexistence)
  - **Higher precision** vs. linear colliders with more Higgs & Z; potential for **proton collider upgrade**.
  - **Lower cost** vs. FCC-ee, ~1/2 the construction cost with similar luminosity up to 240 GeV.
- CEPC is well recognized in particle physics world, as a major choice for the future flagship facility.

Key scientific and technological issues (route)

New Physics
~10 TeV

- ✓ Dark Matter
- ✓ Extended Higgs
- ✓ Composite Higgs
- ✓ Supersymmetry
- ……

High Precision
~1%

- ✓ Higgs: 1%-0.1%
- ✓ EW : O(10^2-10^3) vs current
- ✓ Flavor
- ……

Detector
Particle Flow

- ✓ High Granularity
- ✓ Good Resolution
- ✓ Reliable PID
- ……

Design & Implementation
Detector & Accelerator

- ✓ Multi-purposed Acc.
- ✓ New concept Detector
- ✓ Cost, added values
- ✓ Spill-over
- ……

- ✓ Management
- ✓ Collaboration
- ……

High Lumi.
~$10^{34\text{-}36}$$cm^{-2}s^{-1}$

- ✓ Higgs: 20 ab^{-1}
- ✓ Z: 100 ab^{-1}
- ✓ W: 6 ab^{-1}
- ✓ Top: 1 ab^{-1}

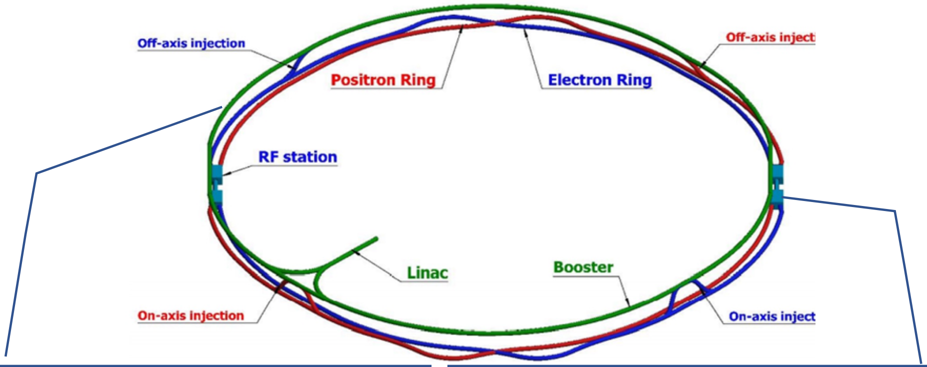
Accelerator
2 IPs/100 km

- ✓ Switchable Operations
- ✓ Upgradability
- ✓ Large Piwinski angle with Crab-waist
- ……

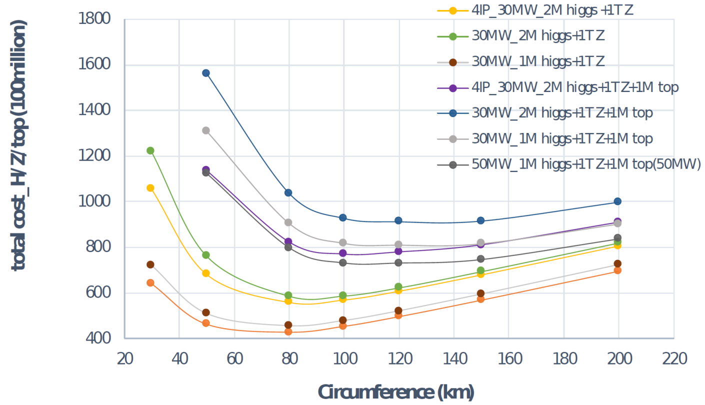
Operation mode	Z	W	Higgs
Center-of-mass energy (GeV)	91	160	240
Operation time (year)	2	1	10
Instantaneous luminosity/IP ($10^{34}cm^{-2}s^{-1}$)	115	16.0	5.0
Integrated luminosity (ab^{-1}, 2 IPs)	60	3.6	12
Event yield (30 MW)	2.5×10^{12}	1.0×10^8	2.5×10^6
Event yield (50 MW)	4.0×10^{12}	1.6×10^8	4.0×10^6

Design of experimental facility and technical requirements

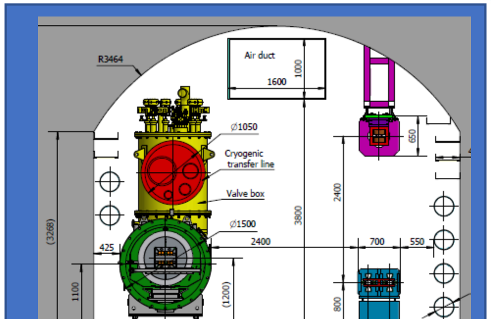
- **Circular collider**: **Higher luminosity** than a linear collider
- **100km circumference**: Optimum **total cost**, good also for **SppC**
- **Shared tunnel**: Accommodate **CEPC** booster &collider and **SppC**
- **Switchable operation**: Higgs, W/Z, top



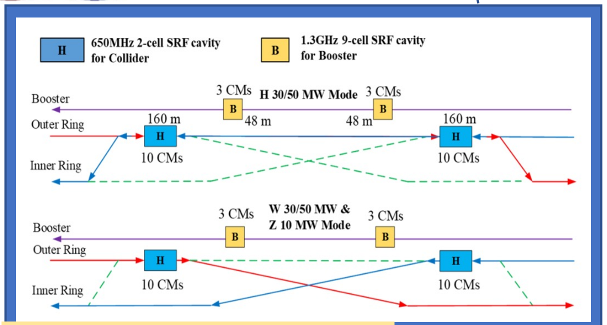
Cost optimization vs.. circumference



D. Wang *et al* 2022 *JINST* **17** P10018



Common tunnel for booster/collider & SppC



Switchable Operation for Higgs W and Z

Main Parameters: High luminosity as a Higgs Factory

	Higgs	W	Z	ttbar
Number of IPs	2			
Circumference [km]	100.0			
SR power per beam [MW]	**50**			
Energy [GeV]	**120**	**80**	**45.5**	**180**
Bunch number	415	2161	19918	59
Emittance (εx/εy) [nm/pm]	0.64/1.3	0.87/1.7	0.27/1.4	1.4/4.7
Beam size at IP (σx/σy) [um/nm]	15/36	13/42	6/35	39/113
Bunch length (SR/total) [mm]	2.3/3.9	2.5/4.9	2.5/8.7	2.2/2.9

RF frequency [MHz]	650			
Luminosity per IP[10^{34}/cm^2/s]	**8.3**	**27**	**192**	**0.83**

Design of experimental facility and technical requirements

GOAL

e+e- circular collider as a high lumi. Higgs factory

Switchable operation for Higgs, W, Z and Top runs

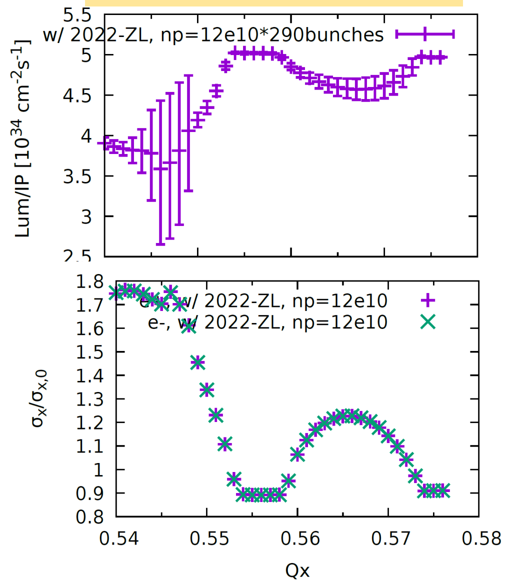
A green machine with a maximum Luminosity

Design

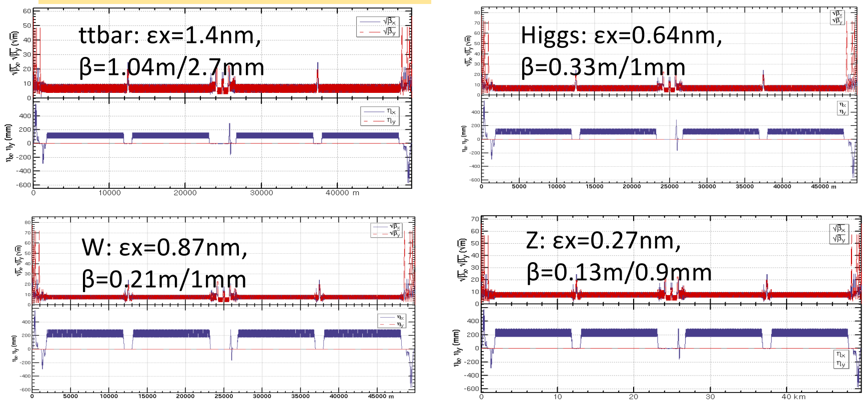
- Complete acc. design w. latest ideas
- Lattice optimization for all energies
- Sufficient DA for all energies
- Beam-beam & collective instability

workable 100km accelerator design for all operation modes – completed

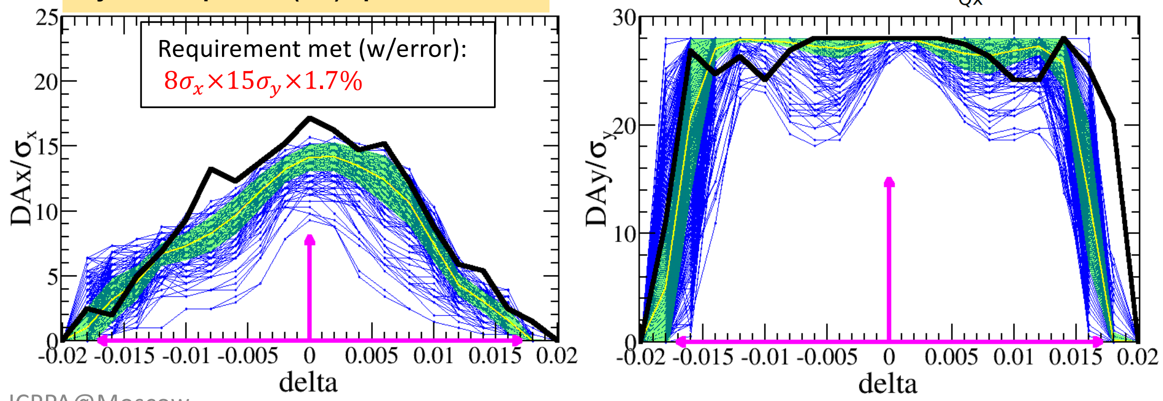
Beam-beam effect study



Lattice for all energies



Dynamic Aperture (DA) optimization



ICPPA@Moscow

Design of experimental facility and technical requirements

Key Technology

- High efficiency klystron
- High Q SRF cavity
- Novel magnet
- PWFA injector
- HTS high field magnet

Status

- Current eff.>70%, aim at 80%
- Exceeds CEPC requirement
- CEPC requirement met
- Design positron acceleration scheme, >10GeV beam
- HTS with IBS

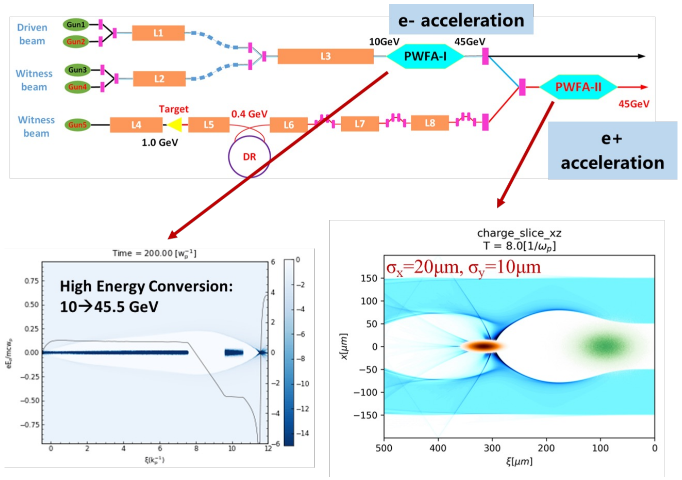
world leading technical performance

Selected Leading Technologies

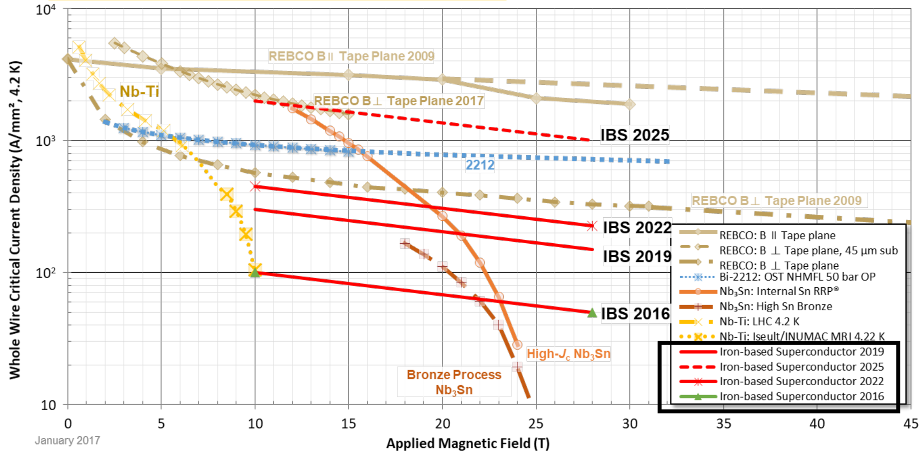
Table 5.3: Status of key technology R&D for CEPC, in comparison with the status quo of world leading accelerator laboratories

Device	Requirement	IHEP status	CERN status	FNAL status	KEK status	LBNL status
1.3 GHz SRF cavity	Q=3×10^{10} @24 MV/m	Q=4.3×10^{10} @31 MV/m	Preliminary progress	Comparable to IHEP	Comparable to IHEP	N/A
650 MHz 2-cell SRF cavity	Q=4×10^{10} @22 MV/m	Q=6×10^{10} @22 MV/m	N/A	Comparable to IHEP	N/A	N/A
High-efficiency klystron	Efficiency $\geq 80\%$	Efficiency $\approx 70\%$	R&D on Efficiency $\approx 80\%$	N/A	Efficiency $\approx 60\%$	N/A
High-field superconducting magnet	20-24 T	12.5 T achieved next goal is 16 T	14-16 T	14.5 T	10 T	14-16 T

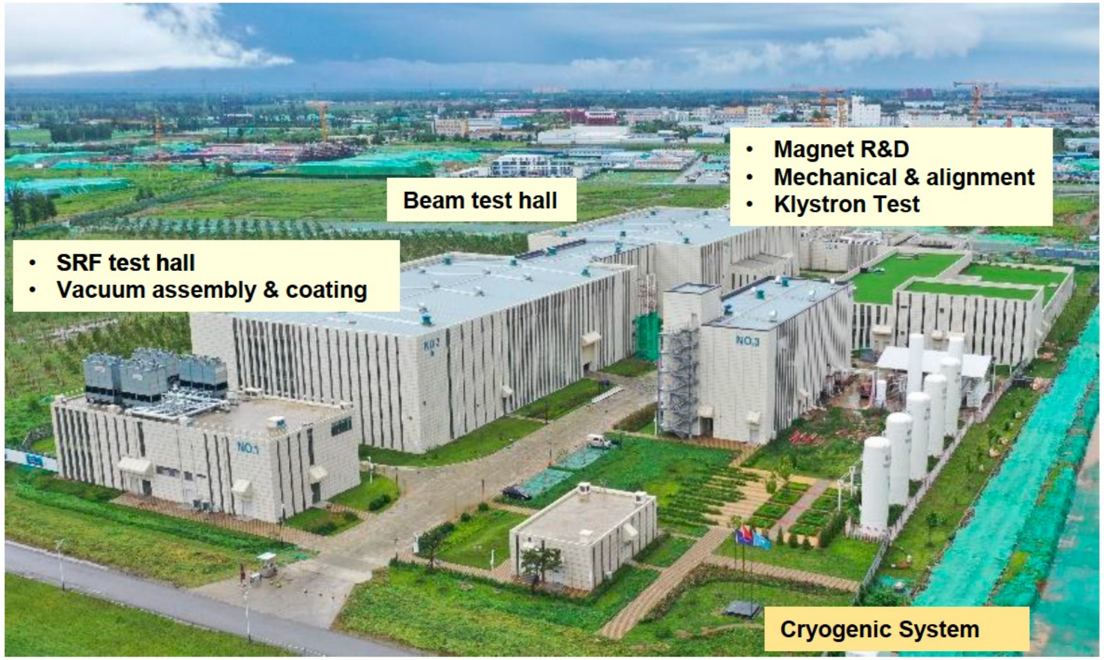
PWFA as an alternative Linac injection

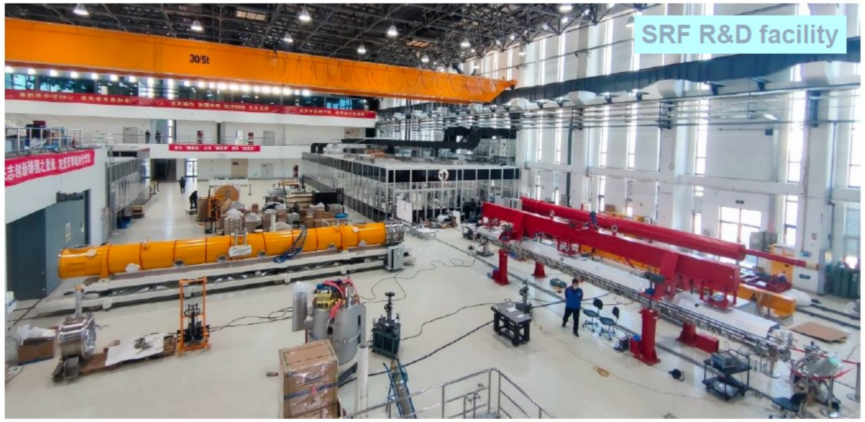


Fast development of IBS material



CEPC key tech R&D Platforms





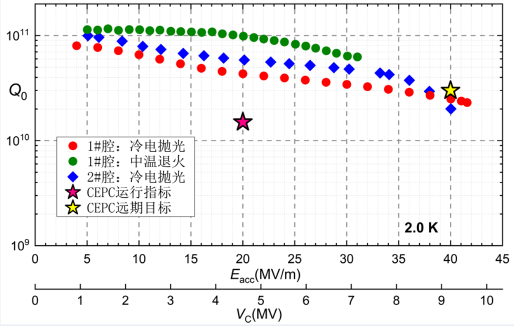
Accelerator key technology R&D platform was established:

- SRF cavity and module
- High precision magnet
- Vacuum assembly & coating
- High efficiency Klystron
- Mechanics and alignment
- Beam test facility

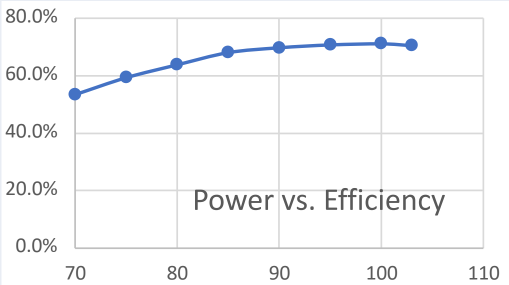
Status and maturities of the CEPC technologies

State-of-the-art: Key Components

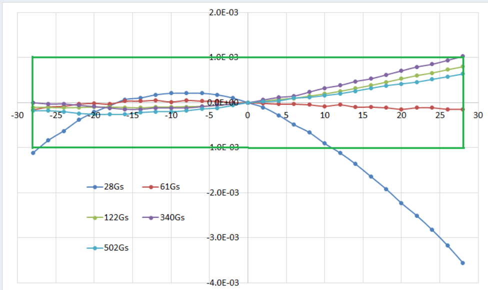
650MHz SRF cavity



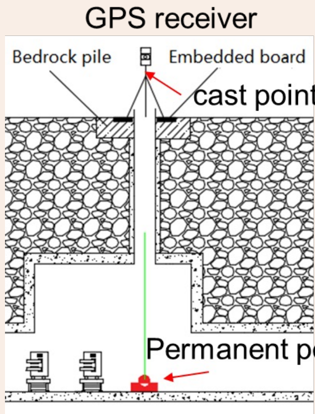
High efficiency klystron



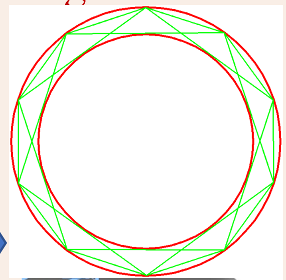
Weak field dipole

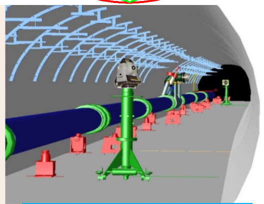


100km Acc. Alignment & Installation R&D

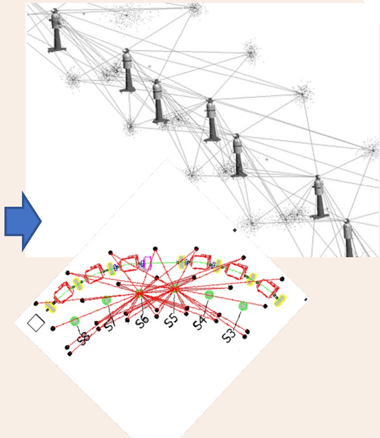


Control Point

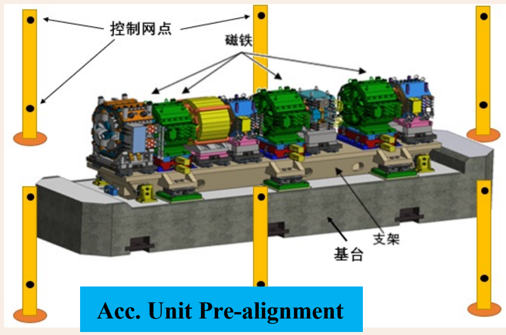




Backbone Network



Tunnel Control Network



Acc. Unit Pre-alignment

Multi Functional Alignment Instrument

Efficient alignment scheme + instrumentation R&D to guarantee the installation within 4 years

Table 5.1: Summary of key technologies under R&D essential for CEPC

Device	Accelerator	Quantity	CEPC specification	R&D status
1.3 GHz SRF cavity (9-cell)	Booster	96	Q=3×10^{10} @ 24 MV/m	Specification met
650 MHz SRF cavity (2-cell)	Collider	240	$Q = 4\times10^{10}$@22 MV/m	Specification met
650 MHz klystron	Collider	120	Efficiency: 80% Power: 800 kW	Prototype manufactured
C-band NC accelerating tube	Linac	292	Gradient: 45 MV/m	Prototype manufactured
S-band bunch compressor	Linac	35	Peak power gain: 7 dB	Prototype manufactured
Positron source flux concentrator	Linac	1	Central peak magnetic field >6 T	Specification met
Dual-aperture dipole magnet	Collider	2384	Field: 140 Gs-560 Gs aperture: 70 mm length: 28.7 m; harmonic$< 5\times10^{-4}$ relative field difference<0.5%	Specification met
Dual-aperture quadrupole magnet	Collider	2392	Gradient: 3.2-12.8 T/m length: 2 m; harmonic$< 5\times10^{-4}$ aperture: 76 mm relative field difference<0.5%	Specification met
Weak field dipole	Booster	16320	Field error $\leq 10^{-3}$@60 Gs	Specification met
Electrostatic separator	Collider	32	Electric field: 2.0 MV/m field uniformity: 5×10^{-4} good field region: 46 mm*11 mm	Specification met by prototype
Cryogenic refrigerator	Collider/ Booster	4	18 kW @ 4.5 K	Collaboration with IPC CAS, a refrigerator system of 2.5 kW @ 4.5 K has been developed
Ceramic vacuum chamber and coating	Transport lines	~ 20	$75\times56\times5\times1200$mm	Prototype in production
MDI SCQ	Collider	8	Gradient: 136T/m; length: 2m Aperture: 40mm; included angle: 33mrad	Prototype in manufacture
Visual instrument	All	11	Image accuracy: 5 μm+(5 μm/m) horizontal angle: 1.8 arc-second vertical angle: 2.2 arc-second	Prototype completed

Table 5.2: Summary of key technologies in engineering applications essential for CEPC

Device type	Accelerator	Quantity	CEPC specifications
S-band copper accelerating tube	Linac	111	$\sim$30 MV/m
vacuum chamber and coating	Collider/ Booster	Total length 200 km	Length: 6 m aperture: 56 mm vacuum: 3×10^{-10} Torr NEG coating pump speed for H_2: 0.5 L/s· cm^2
BPM and electronics	All	$\sim$5000	Closed orbit resolution: 0.6 μm
kicker & fast pulser	Transport line	$\sim$25	Pulse width <10 ns (strip-line) trapezoidal pulse width <250 ns (slotted-pipe)
Lambertson septum	Transport line	$\sim$20	Septum thickness $\leq$3.5 mm (in-air) thickness $\leq$2 mm (in-vacuum)
Power supply	All	9294	Stability 100-1000 ppm
RF-shielded bellows	Collider Booster	24000 /12000	Contact force 125±25 g/finger

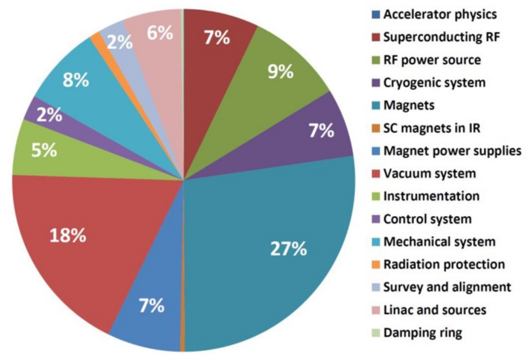

Figure 12.3: Cost breakdown of the CEPC accelerator technical systems.

Design of experimental facility and technical requirements

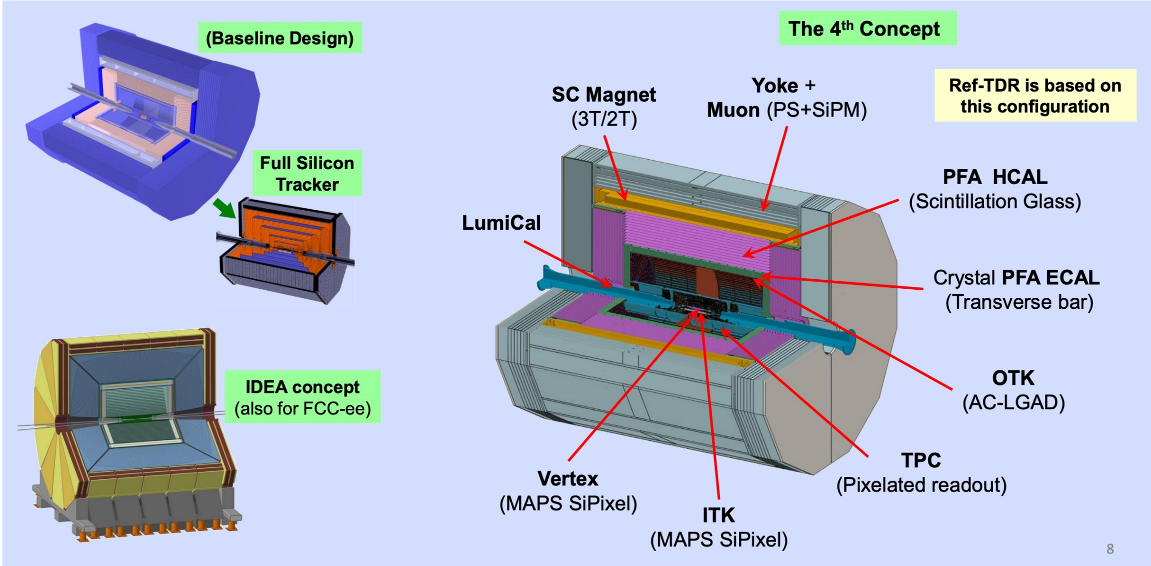
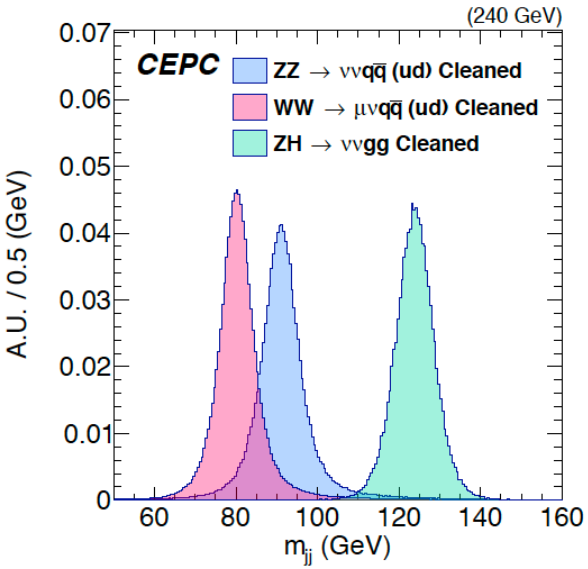
boson mass resolution (BMR ~3%)

→

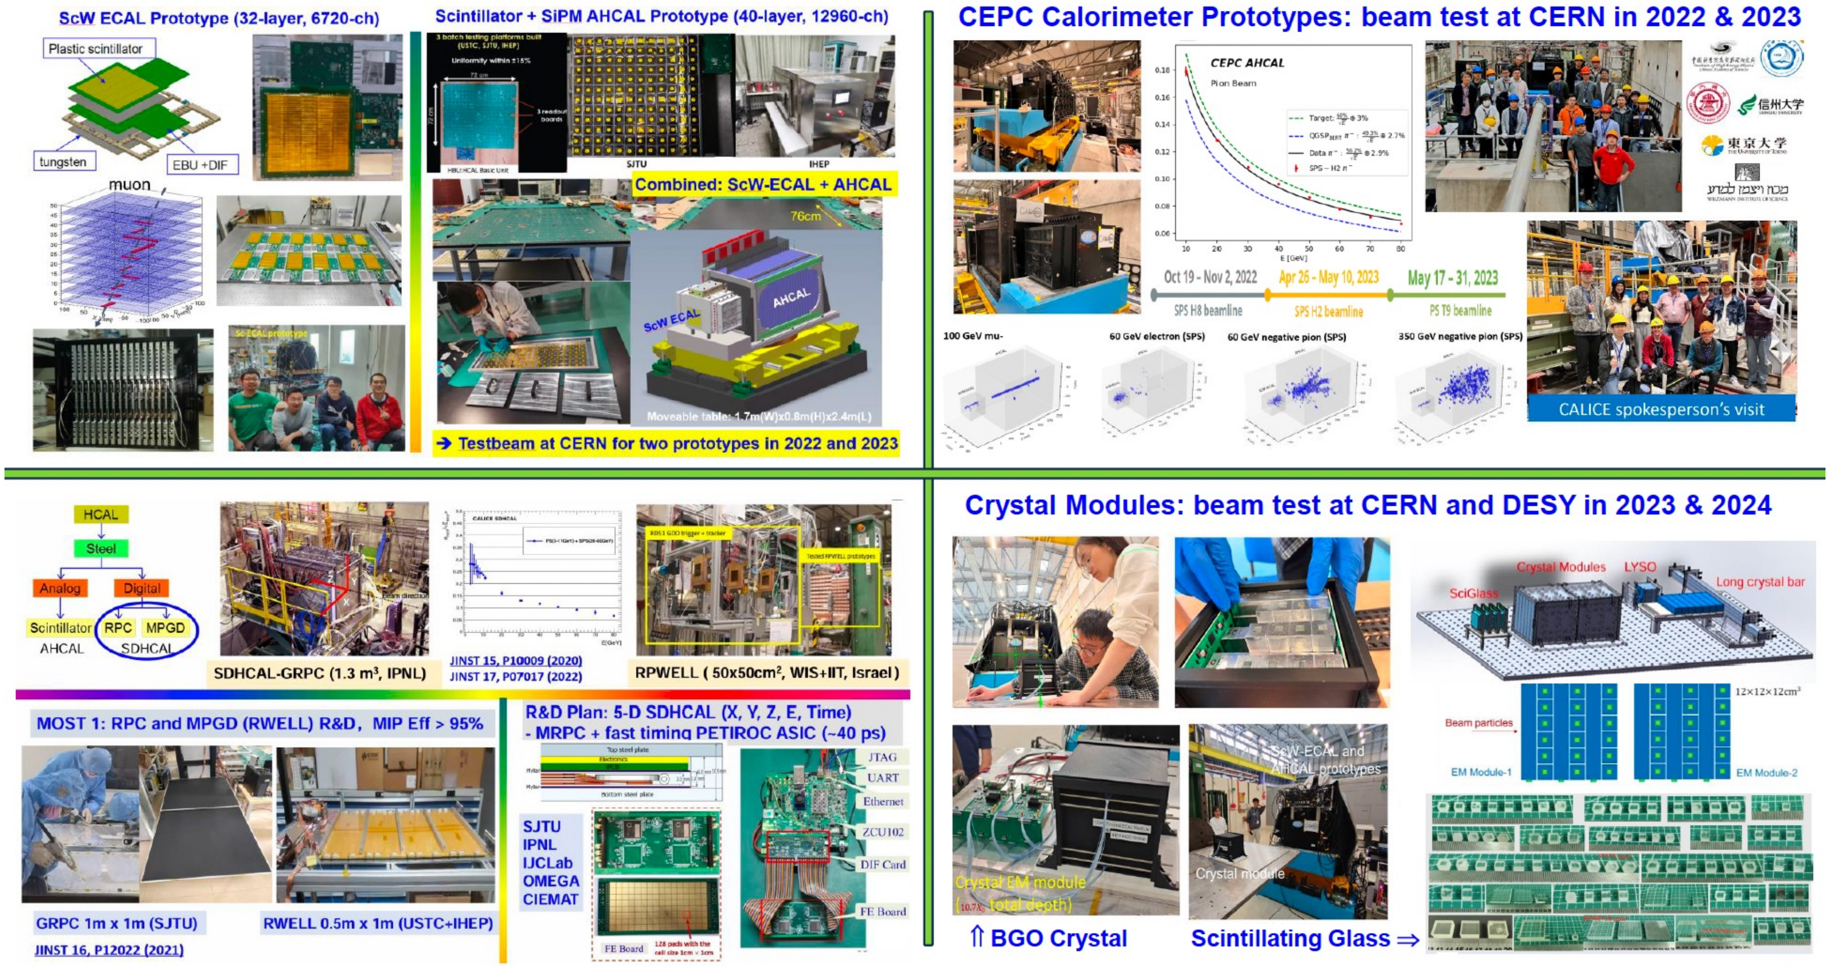
Challenges
PFA Compatible with
- High granularity
- High precision





Detector	Key parameter	World-class level	CEPC design
PFA based EM calorimeter	EM shower E resolution	~20%/√E	<3%/√E
PFA based Hadron calorimeter	Single hadron E resolution	~50%/√E	~40%/√E

Detector R&D efforts



Upgrade capability and added values

SR power per beam upgrade to **50 MW**: High Luminosity (8E34 @ 240 GeV)

The **center-of-mass energy** can increase to **360 GeV**: top quark data

Add a **super proton-proton collider** (SppC) with c.m.s >**100 TeV**

Expandability: High energy & high flux synchrotron light source provides gamma-ray energy up to 300 MeV, critical for multi-disciplinary science

Boost the developments of multiple technologies:
Fast electronics, mechanics, vacuum, beam diagnostics, RF acceleration, cryogenic system, novel magnets, high-accuracy power supplies, control systems, big data, automation and intelligence, etc

- Upgradable scenarios: compatibilities included in design and construction
- Upgrades in several highly valuable ways, bring up discovery power, lifetime spans > 5 decades
- **Significant spillover effects on multidisciplinary sciences and applications**

Status and maturities of the CEPC technologies

- **Extensive detector R&D benefitted from experience**
  - Silicon strip : Experience from ATLAS upgrade
  - MDI, Drift chamber & SC magnet : Experience from BESIII
- **CEPC R&D on key technologies**
  - Silicon pixel, silicon tracker and TPC
  - PFA calorimeter

- **With international partners, all sub-detector covered**
  - PFA calorimeter: with CALICE Collaboration
  - TPC: with LCTPC Collaboration
  - Drift cham: with Italian colleague
  - Silicon tracker: with UK/Germany/Italian colleague
  - Silicon vertex: with French/Spain colleague

Prototypes under evaluation

Sub-detector	Specification	Requirement	World-class level	CEPC prototype
Pixel detector	Spatial resolution	$\sim 3\ \mu m$	$3-5\ \mu m$ [12, 13]	$3-5\ \mu m$ [14–16]
TPC/drift chamber	dE/dx (dN/dx) resolution	$\sim 2\%$	$\sim 4\%$ [17, 18]	$\sim 4\%$ [19–21]
Scintillator-W ECal	Energy resolution Granularity	$< 15\%/\sqrt{E(\text{GeV})}$ $\sim 2 \times 2\ \text{cm}^2$	12.5% [22]	Prototype built to be measured $0.5 \times 0.5\ \text{cm}^2$

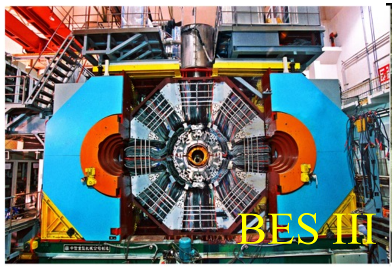
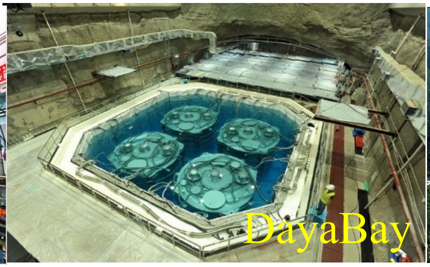
IAC: global renowned scientists and top laboratory or project leaders who have ample experience in project management, planning, and execution of strategies, **operating since 2015**

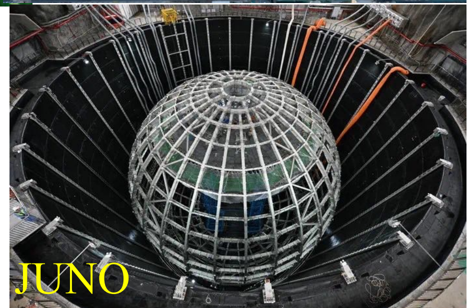
IARC & IDRC: leading experts of this field, provide guide to the project director

Core team, the host institution and the existing support





- IHEP is one of the few institution in the world that
  - has rich management experience and successful constructed many large scientific facilities
  - has a full coverage of all technical disciplines for accelerators and detectors, in particular for the design and construction of circular e+e- collider(BEPCII) and the detector(BESIII)
  - has all needed infrastructure for the construction of large facilities
  - has successfully hosted international projects such as BESIII, Daya Bay, JUNO, LHAASO, etc.
- **CEPC is committed by IHEP and workplan endorsed by CAS**



Core team, the host institution and the existing support

International collaboration

CEPC attracts significant International participation

- Conceptual design report: 1143 authors from 221 institutes (including 140 International Institutes)
- More than 20 MoUs signed and executed

- Intensive collaboration on Physics studies
- Oversea scientists made substantial contributions to the R&D, especially the detector system

- CEPC International Workshop since 2014
- EU-US versions of CEPC WS: Next one at Marseille
- Annual working month at HKIAS (since 2015)

Abstract

The Higgs boson, discovered in 2012 by the ATLAS and CMS Collaborations at the Large Hadron Collider (LHC), plays a central role in the Standard Model. Measuring its properties precisely will advance our understandings of some of the most important questions in particle physics, such as the naturalness of the electroweak scale and the nature of the electroweak phase transition. The Higgs boson could also be a window for exploring new physics, such as dark matter and its associated dark sector, heavy sterile neutrino, et al. The Circular Electron Positron Collider (CEPC), proposed by the Chinese High Energy community in 2012, is designed to run at a center-of-mass energy of 240 GeV as a Higgs factory. With about one million Higgs bosons produced, many of the major Higgs boson couplings can be measured with precisions about one order of magnitude better than those achievable at the High Luminosity-LHC. The CEPC is also designed to run at the Z-pole and the W pair production threshold, creating close to one trillion Z bosons and 100 million W bosons. It is

collaboration would be crucial at this stage. This submission for consideration by the ESPP is part of our dedicated effort in seeking international collaboration and support. Given the importance of the precision Higgs boson measurements, the ongoing CEPC activities do not diminish our interests in participating in the international collaborations of other future electron-positron collider based Higgs factories.

Snowmass2021 White Paper AF3- CEPC

CEPC Accelerator Study Group[1]

1. Design Overview

1.1 Introduction and status

The discovery of the Higgs boson at CERN's Large Hadron Collider (LHC) in July 2012 raised new opportunities for large-scale accelerators. The Higgs boson is the heart of the Standard Model (SM), and is at the center of many biggest mysteries, such as the large hierarchy between the weak scale and the Planck scale, the nature of the electroweak phase transition, the original of mass, the nature of dark matter, the stability of vacuum, etc. and many other related questions. Precise measurements of the properties of the Higgs boson serve as probes of the underlying fundamental physics principles of the SM and beyond. Due to the modest Higgs boson mass of 125 GeV, it is possible to produce it in the relatively clean environment of a circular electron–positron collider with high luminosity, new technologies, low cost, and reduced power consumption. In September 2012, Chinese scientists proposed a 240 GeV *Circular Electron Positron Collider* (CEPC), serving two large detectors for Higgs studies and other topics as shown in Fig. 1. - CEPC provides critical input to ESPPU & Snowmass as a **major player**
- Team member actively participated International study(ESPPU and Snowmass committees) and Panel discussions

CEPC attracts intensive international collaboration, ensuring that the CEPC design and technology are among the most advanced in the world. once approved, CEPC is expected to be substantially supported by international community.

Core team, the host institution and the existing support

Industrial engagement

- CIPC, established in 2017, composed of ~ 70 high tech. enterprises, covers Superconducting materials, Superconducting cavities, cryomodules, cryogenics, Klystrons, electronics, power source, vacuum, civil engineering, etc. CIPC actively joins the Key technology R&D and **prepares for the mass production** for the CEPC construction.
- CEPC study group is **surveying main international suppliers.**
- CEPC strongly promote these relevant technology development (cost-benefit).

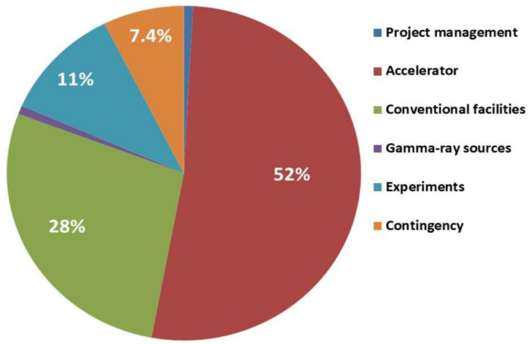
Distribution of CEPC Project TDR cost of 36.4B RMB (~4.7B Euro)

Table 12.1.2: CEPC project cost breakdown, (Unit: 100,000,000 yuan)

Total	364	100%
Project management	3	0.8%
Accelerator	190	52%
Conventional facilities	101	28%
Gamma-ray beam lines	3	0.8%
Experiments	40	11%
Contingency (8%)	27	7.4%



Budgets for R&D and construction, and the timeline

2012.9	2015.3	2018.11	2023.12	2025.6	2027	15th five year plan (2026-2030)
proposed	Pre-CDR	CDR	Acc. TDR	Det. TDR	EDR	Start of construction

CEPC EDR Phase: 2024-2027

- **CEPC Accelerator EDR** starts with 35 WGs in 2024, to be completed in **2027**
- **CEPC Reference Detector TDR** will be released by June, **2025**
- **CEPC proposal** will be submitted to the Chinese government for approval in **2025**
- **Upon approval**, establish at least two international collaborations on experiments
- **CEPC construction starts** during the 15th five-year plan (2026-2030, e.g. **2027**)
- **CEPC construction complete** around **2035**, at the end of the 16th five-year plan

China could start building world's biggest particle collider in 2027

The US$5 billion facility would be cheaper, bigger and faster to build than a similar one proposed by European scientists.

ICPPA@Moscow

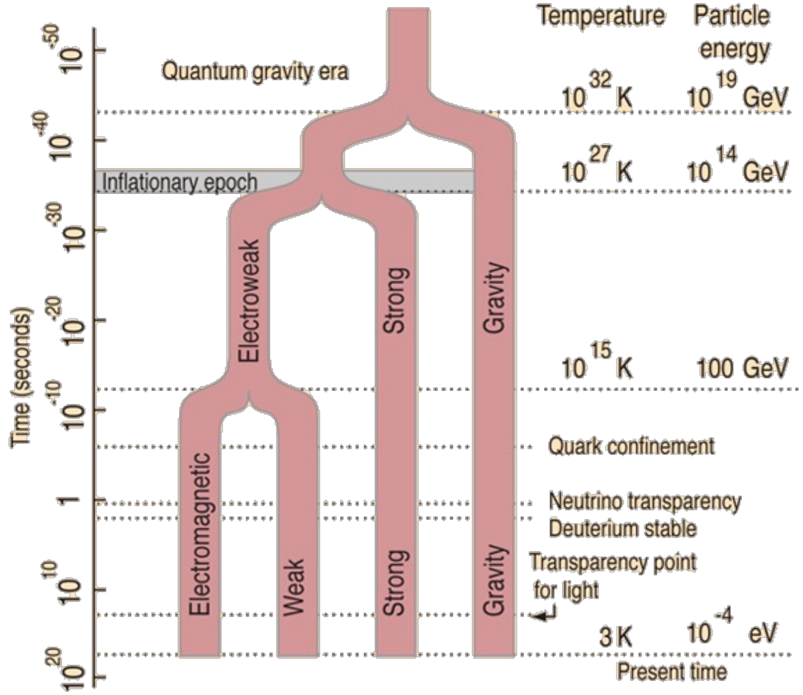
Summary

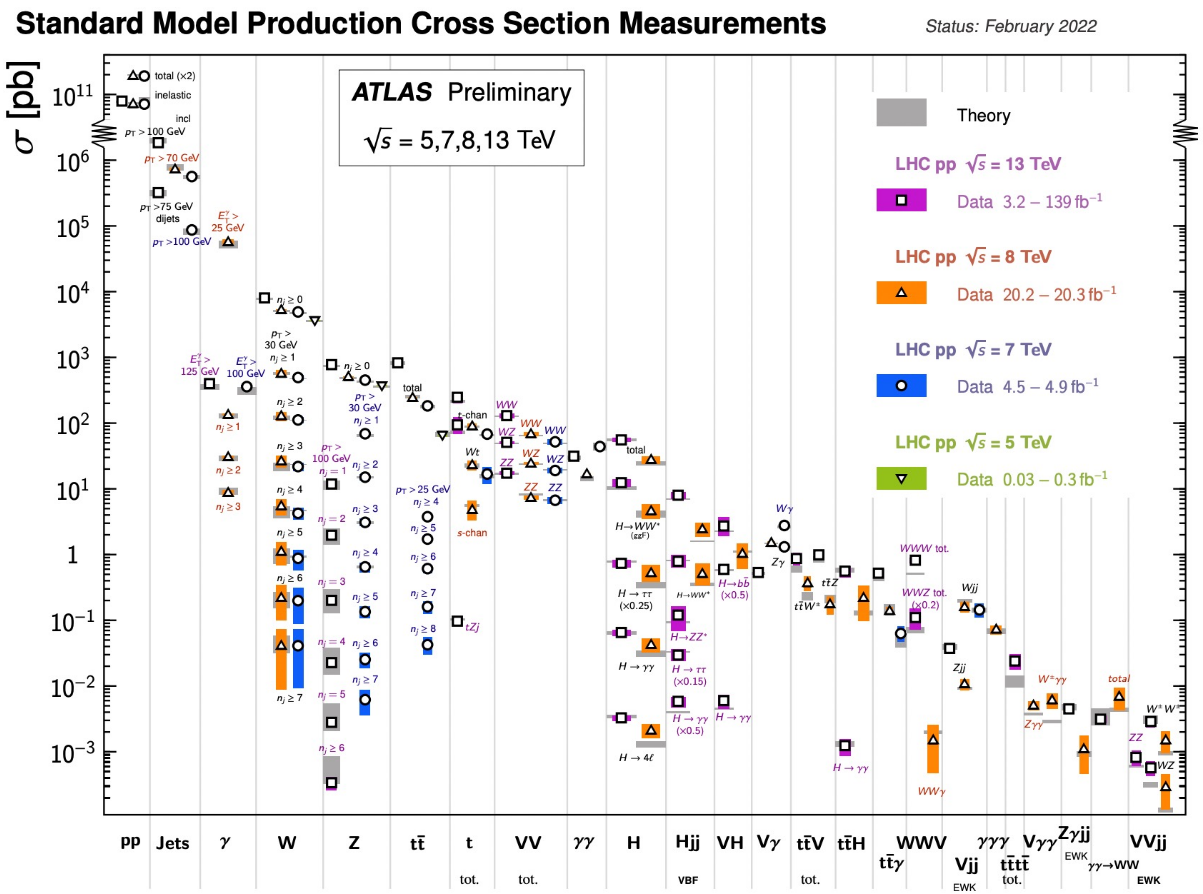
CEPC

- will address most pressing & critical science problems
- adds enormous strategic values; has many advantages;
  will be in a leading position if realized.
- design-technologies reaching maturity;
  offers great upgrade options and many added values and benefits
- has a strong-experienced team, IHEP support and international cooperation, which are keys to bring CEPC to fruition
- schedule follows China's 5-year planning; expects to complete R&D and preparation to build the facility and carry out the science program
- will position China to be a leading position in particle physics and contribute to the world in a major way.

Back up

The SM: predicts and interprets almost all the experimental data at accelerator experiments





ICPPA@Moscow

The challenges to the SM

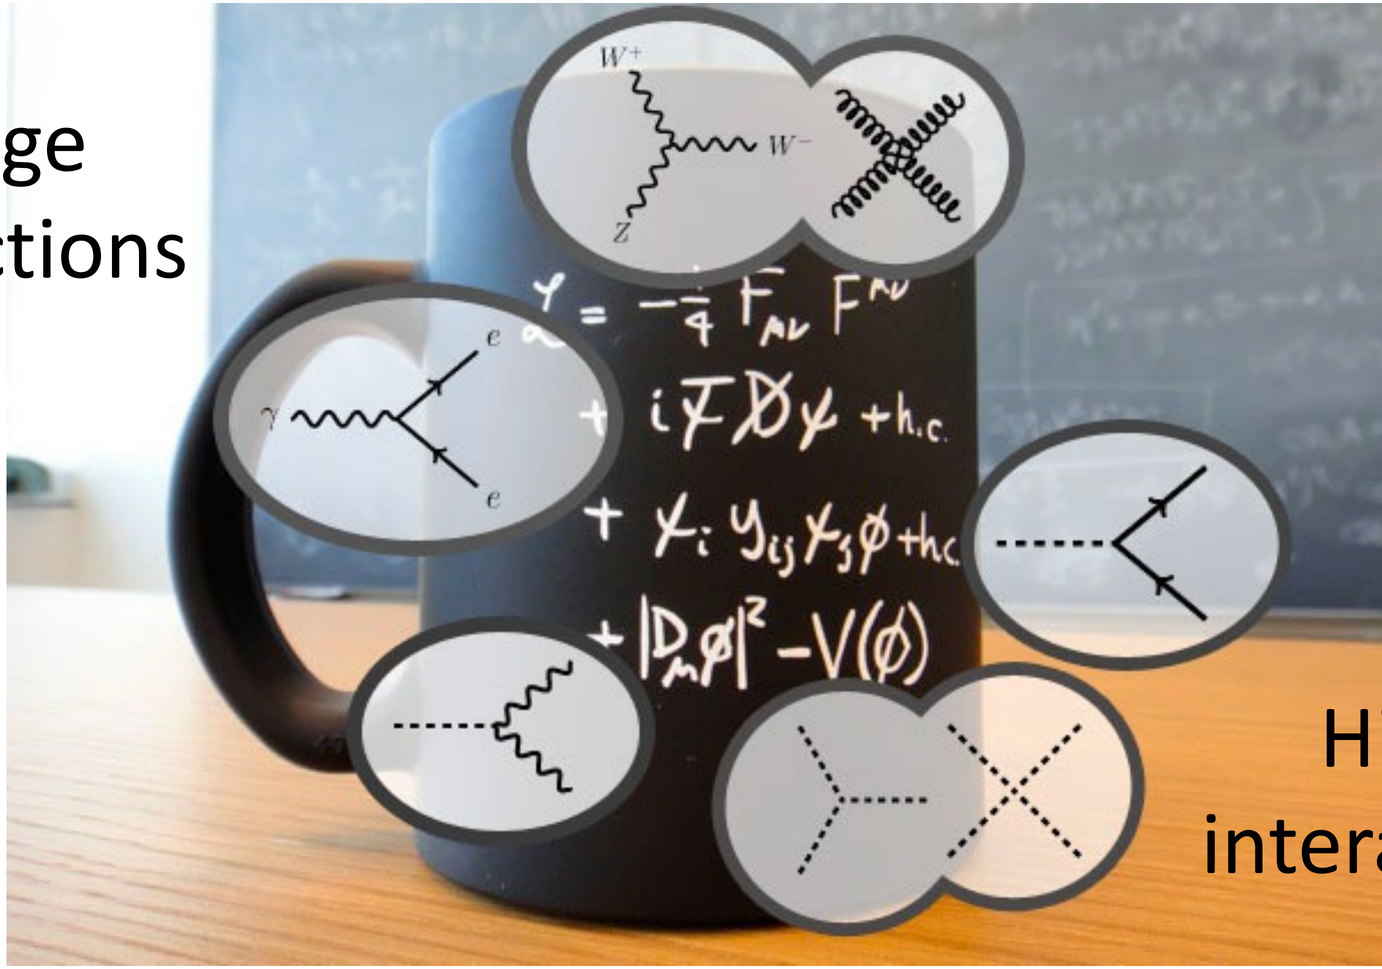
- Inflation
- Mass hierarchy
- Neutrino Mass
- Matter-Anti matter asymmetry
- Stability of the Universe: depends on the Particle Mass
- Dark Matter: nature & origin of mass…
- Dark Energy, Inflation: nature…

The challenges to the SM

- Inflation
- Mass hierarchy
- Neutrino Mass
- Matter-Anti matter asymmetry
- Stability of the Universe: depends on the Particle Mass
- Dark Matter: nature & origin of mass…
- Dark Energy, Inflation: nature…

The Higgs field, heart of the SM

Gauge interactions



Higgs interactions

The Higgs field, origin of mass – associated with most of the Challenges to the SM

- Higgs interactions: beyond the gauge interactions
- Determines the mass of the SM particles,
  - The mass of electron – size of the atom
  - The mass of W & Z boson – strength of the weak interaction
  - The mass of up & down quark – stability of the proton
  - The mass of top & Higgs – stability of the universe
- Couples to the matter & anti-matter in a slightly different manner -> origin of matter

- *Could well be the origin of dark matter mass, and could be also highly relevant to the dark energy & inflations*

Status and maturities of the CEPC technologies

- CEPC received ~ 260 Million CNY from MOST, CAS, NSFC, etc for R&D
- Large amount of key technologies validated in other projects by IHEP: BEPCII, HEPS, …

CEPC R&D ~ 50% cost of acc. components	➢ **High efficiency klystron** ➢ **650MHz SRF cavities** ➢ **Key components to e+ source** ➢ **High performance Linac** ➢ **Electrostatic Deflector** ➢ **Cryogenic system**	➢ **Novel magnets: Weak field dipole, dual aperture magnets** ➢ **Extremely fast injection/extraction** ➢ **Vacuum chamber tech.** ➢ **Survey & Alignment for ultra large Acc.** ➢ **MDI**
BEPCII / HEPS ~ 40% cost of acc. components	➢ **High precision magnet** ➢ **Stable magnet power source** ➢ **Vacuum chamber with NEG coating** ➢ **Instrumentation, Feedback system** ➢ **Traditional RF power source** ➢ **SRF cavities**	➢ **Electron Source, traditional Linac** ➢ **Survey & Alignment** ➢ **Ultra stable mechanics** ➢ **Radiation protection** ➢ **Cryogenic system** ➢ **MDI**

~10% missing items consist of anticipated challenges in the machine integration, commissioning etc. and the corresponding international contribution

Design of experimental facility and technical requirements

Innovative Design	➢ 100km Full/Partial Double Rings ➢ Switchable operation for Higgs, W and Z ➢ Flexible injection modes to satisfy different energies ➢ World's 1st design of a high energy/flux gamma-ray synchrotron light
Technical Performance	➢ High efficiency Klystron (aim at highest transfer efficiency) ➢ High performance SRF cavities (state-of-the-art Q and gradient) ➢ Novel magnets: Weak field dipole, dual aperture magnets (First Qualified Prototype)
Major Technology Breakthrough	➢ Plasma wakefield acceleration for Injector(New Acceleration Principle) ➢ High field superconducting magnet (Iron based HTS proposal)

Innovative designs and key technology R&D fulfill the challenging requirement.

Design of experimental facility and technical requirements

CEPC: innovative design & key technologies R&D at the leading position of international future colliders.
