Cosmological models in the scalar-tensor theories of gravity, consistent with observational constraints

Wednesday, 23 October 2024 11:00 (15)

This work considers two classes of cosmological models based on scalar-tensor theories of gravity. The models are obtained using certain functional relationships between the dynamics of the expansion of the Universe and the type of scalar-tensor theories of gravity. The consistency of the models with observational constraints according to Planck-2018 data is considered.
