Simulation for neutron - boron-10 interaction in coating of gaseous tube counter anode wire and moving of secondary nuclei in media

Thursday, 24 October 2024 16:30 (30)

An simulation for two main reactions of fast neutron and boron-10 inteaction in anode wire coating of gas-discharge tube counter is performed.

Moving of secondary nuclei ${}^4\text{He}$ и ${}^7\text{Li}$ within coating is considered.

Residual energy of nuclei is calculated taking into account reaction kinematics.

It was found that a condition for a both nucleus exit from anode to counter gas must be claiming enough high energy above 3 MeV and small wire external radius below $20\mu\text{m}$.
