The 7th international conference on particle physics and astrophysics

Contribution ID : 294

Type : Poster

On the possibility of using scintillation material Li2CaSiO4:Eu2+ in solid-state reactor antineutrino detectors.

Tuesday, 22 October 2024 17:05 (115)

At the present time, a scintillation material ⁶Li₂CaSiO₄:Eu²⁺ (LCS) is being developed at the NRC "Kurchatov Institute". This material is designed for neutrons registration by capturing by the ⁶Li isotope. The work presents the possibility of using LCS for neutrons detection after the inverse beta decay reaction ($\bar{\nu}_e + p \rightarrow n + e^+$), which is widely used for antineutrinos registration in reactor experiments. It is shown that when using LCS in combination with a plastic scintillator (EJ-200, which acts as a target for antineutrinos and registers positrons), selection by pulse shape allows the signals of two scintillators to be separated, which demonstrates the possibility of using this material in antineutrino experiments.

Primary author(s) : RASTIMESHIN, A. (National Research Centre «Kurchatov Institute», National Research Nuclear University «MEPhI»)

Co-author(s) : Mr. KOMENDO, Ilya (NRC "Kurchatov Institute", Moscow, Russia)

Presenter(s) : RASTIMESHIN, A. (National Research Centre «Kurchatov Institute», National Research Nuclear University «MEPhI»)

Session Classification : Poster session

Track Classification : Neutrino physics
