## **Sensitivity of the $\nu$ GeN experiment to the antineutrino magnetic moment and millicharge**

*Tuesday, 22 October 2024 17:05 (115)*

The  $\nu$ GeN experiment aims to study coherent elastic neutrino-nucleus scattering and antineutrino electromagnetic properties. The experimental setup is deployed at the Kalinin Nuclear Power Plant. The data is collected with the help of a 1.4 kg high purity germanium detector located at about 11 meters from the reactor core. This poster presents the estimate of the sensitivity of the  $\nu$ GeN experiment to antineutrino magnetic moment and charge. The estimate is performed based on the energy deposition spectrum corresponding to 69.2 days exposition time in the reactor OFF regime.
