

# Feasibility studies of open charm production in future ALICE-3 experiment at HL-LHC

Mikhail Malaev

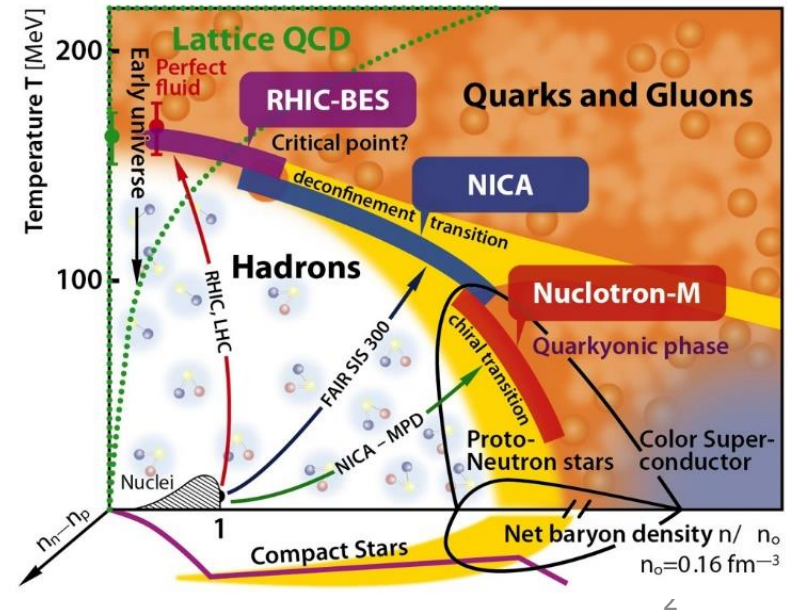

# Introduction

## Advanced detector:

- Compact all-silicon tracker with high-resolution vertex detector
- Superconducting magnet system
- Particle Identification over large acceptance:
- muons, electrons, hadrons, photons
- Fast read-out and online processing

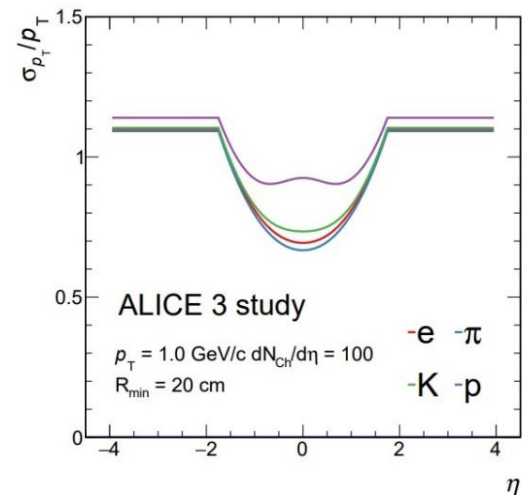

- ✓ Heavy quarks, like charm and beauty, are sensitive probes to investigate the colour-deconfined medium created in high-energy heavy-ion collisions
- ✓ Because of their large mass, heavy quarks are mainly produced in the early times of the collision, before the formation of the QGP
- ✓ High  $p_T$  – in-medium parton energy loss
- ✓ Comparison to light-flavor – dependance of the energy loss on the color charge and quark mass
- ✓ Hadronisation mechanisms studies

# ALICE3 concept: tracker

Layer	Material	Intrinsic thickness (% $X_0$ )	Barrel layers		Forward discs		
			Length ( $\pm z$ ) (cm)	Radius ( $r$ ) (cm)	Position ( $ z $ ) (cm)	$R_{in}$ (cm)	$R_{out}$ (cm)
0	0.1	2.5	50	0.50	26	0.50	3
1	0.1	2.5	50	1.20	30	0.50	3
2	0.1	2.5	50	2.50	34	0.50	3
3	1	10	124	3.75	77	5	35
4	1	10	124	7	100	5	35
5	1	10	124	12	122	5	35
6	1	10	124	20	150	5	80
7	1	10	124	30	180	5	80
8	1	10	264	45	220	5	80
9	1	10	264	60	279	5	80
10	1	10	264	80	340	5	80
11	1				400	5	80

# ALICE3 concept: ECAL

- The Electromagnetic Calorimeter (ECAL) is planned to cover the full central barrel region and one forward region, i.e. the rapidity range of  $-1.6 < \eta < 4$
- Most of the rapidity range will be instrumented with a sampling calorimeter (ECAL)
- A fraction of the central barrel will be covered by existing  $\text{PbWO}_4$  crystal for the high precision measurements

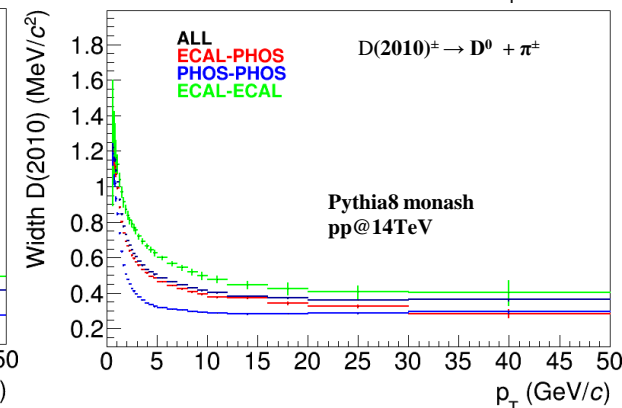

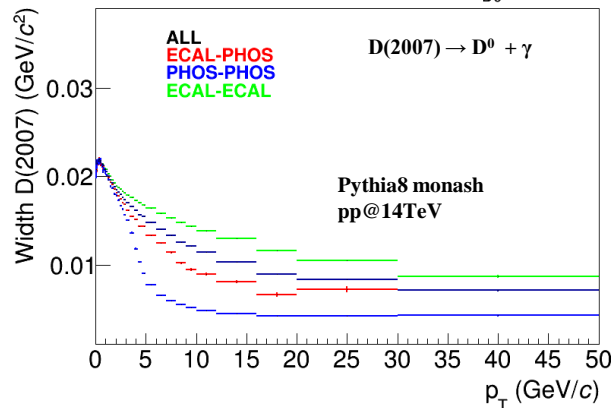

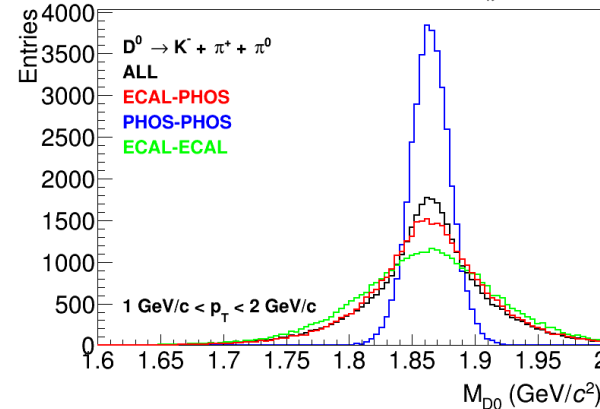

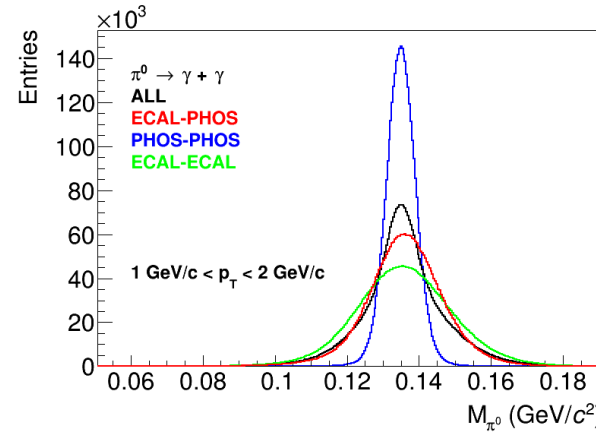

ECAL energy resolution:

$$\frac{\sigma_E}{E} = \frac{a}{E} \oplus \frac{b}{\sqrt{E}} \oplus c$$

ECAL module	Barrel sampling	Endcap sampling	Barrel high-precision
acceptance	$\Delta\phi = 2\pi,$ $ \eta  < 1.5$	$\Delta\phi = 2\pi,$ $1.5 < \eta < 4$	$\Delta\phi = 2\pi,$ $ \eta  < 0.33$
geometry	$R_{\text{in}} = 1.15 \text{ m},$ $ z  < 2.7 \text{ m}$	$0.16 < R < 1.8 \text{ m},$ $z = 4.35 \text{ m}$	$R_{\text{in}} = 1.15 \text{ m},$ $ z  < 0.64 \text{ m}$
technology	sampling Pb + scint.	sampling Pb + scint.	$\text{PbWO}_4$ crystals
cell size	$30 \times 30 \text{ mm}^2$	$40 \times 40 \text{ mm}^2$	$22 \times 22 \text{ mm}^2$
no. of channels	30 000	6 000	20 000
energy range	$0.1 < E < 100 \text{ GeV}$	$0.1 < E < 250 \text{ GeV}$	$0.01 < E < 100 \text{ GeV}$

# Simulation

- ❖ Pythia8 (Monash 2013 tune)  
pp@14TeV
- ❖ Pythia8 (Angantyr mode)  
PbPb@5.5TeV
- ❖  $D^0 \rightarrow \pi^\pm + K^\pm + \pi^0$  ( $\pi^0 \rightarrow \gamma + \gamma$ )  
(BR ~ 14%)
- ❖  $D(2007) \rightarrow D^0 + \gamma$  (BR ~ 38%)
- ❖  $D(2010)^\pm \rightarrow D^0 + \pi^\pm$  (BR ~ 68%)
- ❖ 2  $\gamma$  in High precision part of the calorimeter – PHOS-PHOS
- ❖ 2  $\gamma$  in ECAL acceptance – ECAL-ECAL
- ❖ 1  $\gamma$  in high precision part and 1 outside – ECAL-PHOS

# Simulation: Cut optimization

## DCA (distance of closest approach) cut:

- ❖ All prompt particles go from 0 (primary vertex)
- ❖ Tracks from  $D^0$  decay have non-zero DCA
- ❖  $p_T$  dependent cut equal to DCA resolution estimation ([2211.02491.pdf \(arxiv.org\)](https://arxiv.org/abs/2211.02491))

## Distance cut:

- ❖ Signal - distance between tracks always 0
- ❖ Background - pairs distributed in wide range
- ❖ Distance  $< 50 \mu\text{m}$

## Pointing angle cut:

- ❖ Signal - close to 1
- ❖ Background - from -1 to 1
- ❖  $\text{Cos}(p.\text{angle}) > 0.9$

# Merged Clusters in calorimeter

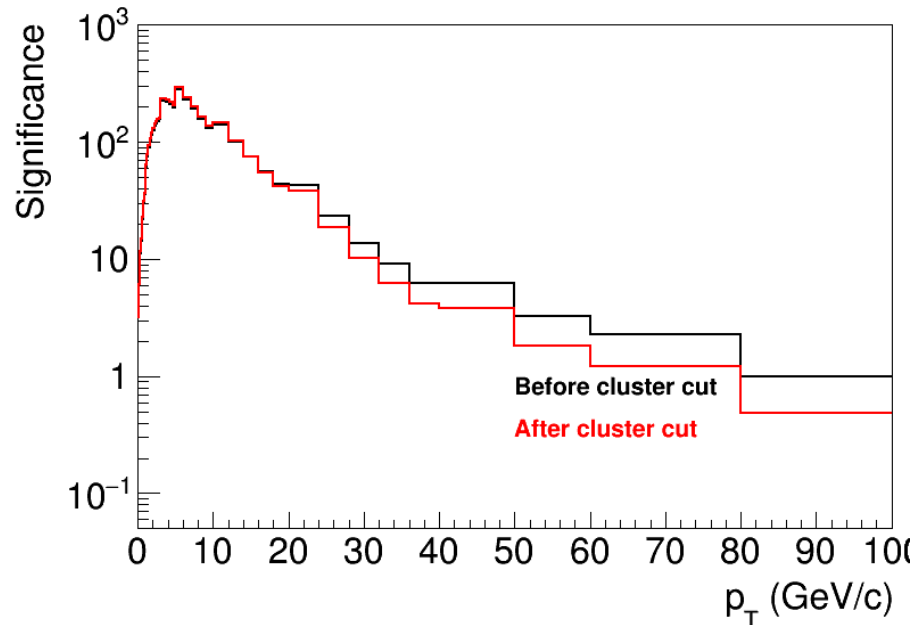

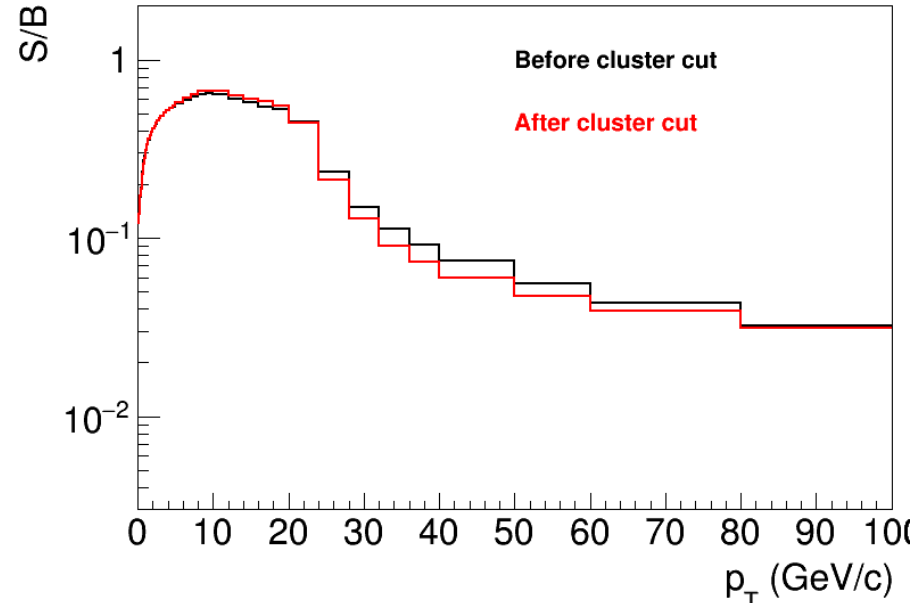

- ❖ Non-zero calorimeter cell size
- ❖ 1 cluster may contain signal from more than 1 photon (Merged clusters)
- ❖ Higher  $p_T$  of  $\pi^0 \rightarrow$  higher possibility for merged clusters for decay photons
- ❖ Merged clusters more elliptic form than “round”
- ❖ The shower shape of a cluster is described using an ellipsoidal parametrization by the axis of the shower surface ellipse ( $\lambda_0$  – long axis,  $\lambda_1$  – short axis)

## Simple Clusterizer

- ❖ Min  $E_\gamma$  cut (ECAL – 100 MeV, PHOS – 10 MeV)
- ❖ Points where photons cross calorimeter surface ( $R = 115$  cm)
- ❖ If distance between two points  $< 1.5 * \text{Cell\_Size}$  (ECAL – 30 mm, PHOS – 22 mm) than Merged cluster with center closer to photon with higher energy (weights)
- ❖ Look for possible candidates to merge with this cluster
- ❖ And again

# Approach A: NO merged clusters ( $D^0$ )

**SIGNAL** - If distance between points from 2 gamma quants on the calorimeter surface less than  $1.5 * \text{Cell\_Size}$  (PHOS and ECAL)  $\pi^0$  is excluded from the analysis – lost signal

**BGR** – Merged clusters used as single photon for  $\pi^0$  reconstruction

# Approach B: Only merged clusters (sources of clusters)

1.5\*Cell\_Size

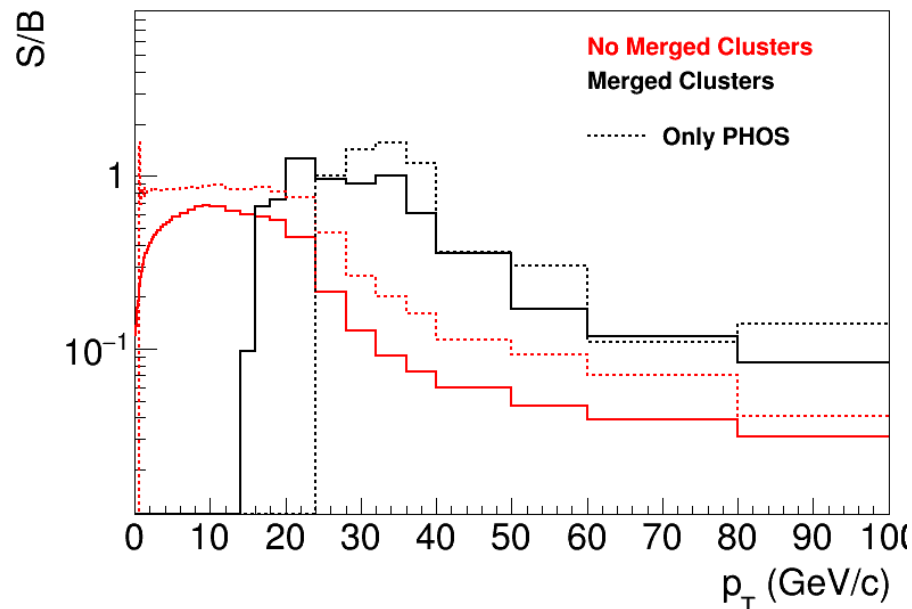

1.0\*Cell\_Size

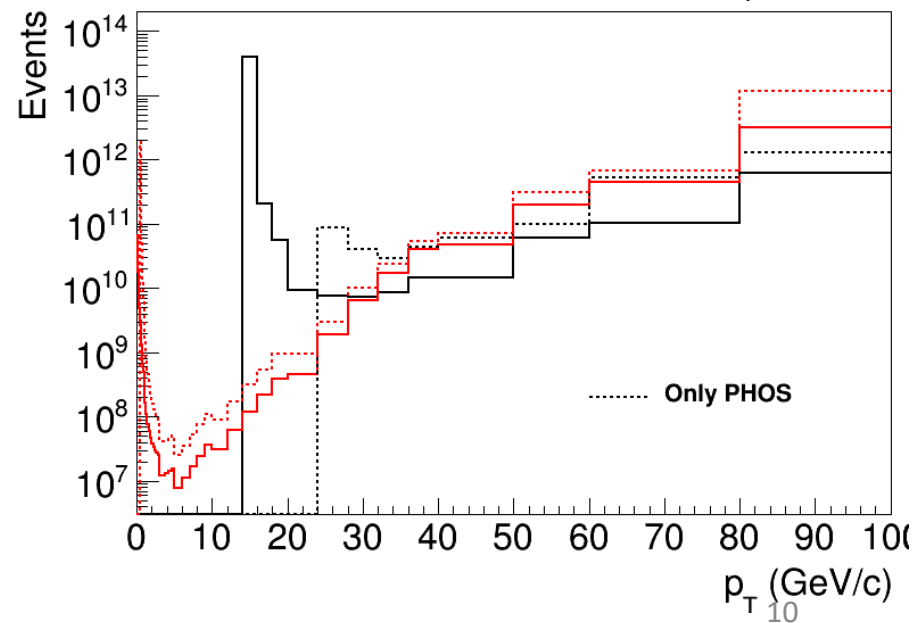

- ❖ Cell\_Size = 22(30) mm for PHOS(ECAL)
- ❖  $E_{\text{cl}} > 20$  GeV: Most of the merged clusters from neutral pions decays
- ❖  $E_{\text{cl}} > 20$  GeV: Dominant contribution to the energy of the cluster is from  $\pi^0$
- ❖ Tighter conditions for clusterizer do not considerably improve results
- ❖ Additional cut on  $\pi^0$  transverse momentum 20 GeV/c

# Approach B: Only merged clusters ( $D^0$ )

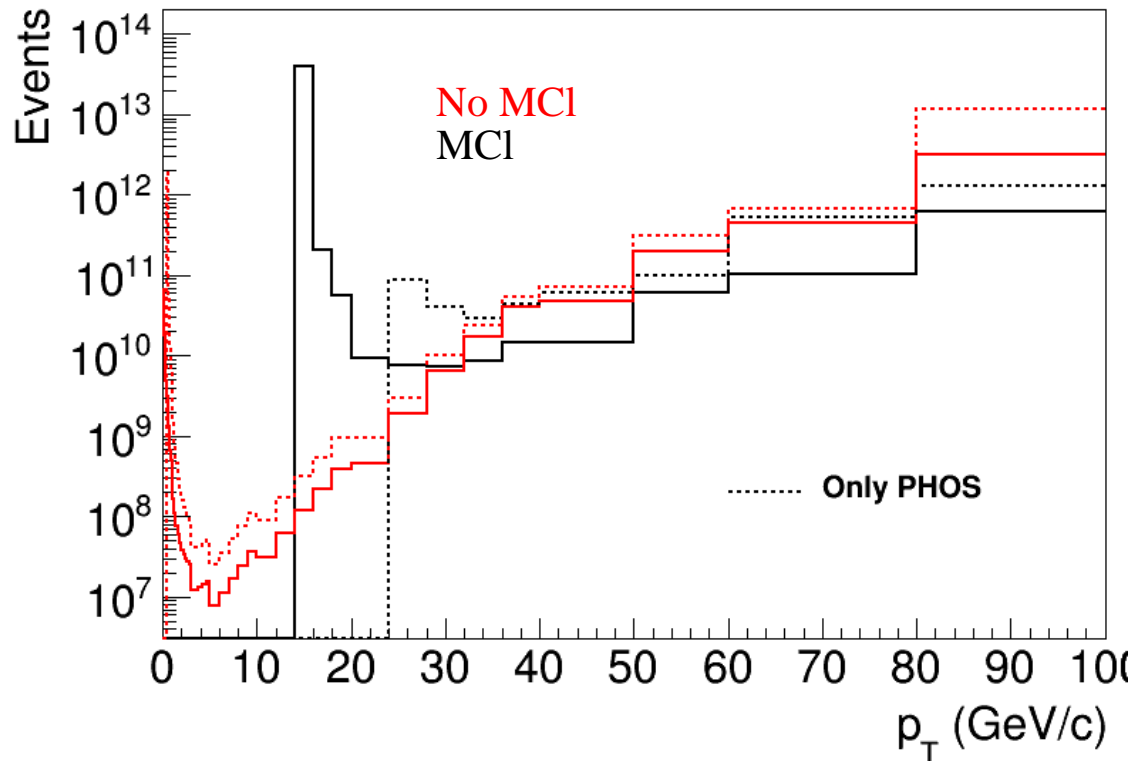

**SIGNAL** – If two gamma quants from  $\pi^0$  decay do not merge in one cluster such  $\pi^0$  is excluded from the analysis – lost signal

**BGR** – Signal from calorimeter is used as  $\pi^0$  (assumption that this signal consist of 2 gamma quants from the same neutral pion)

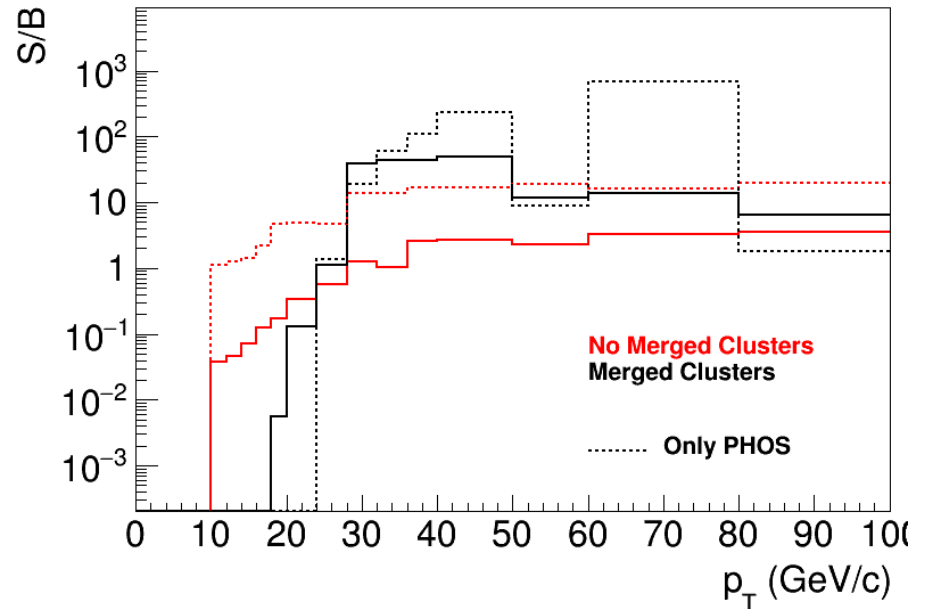

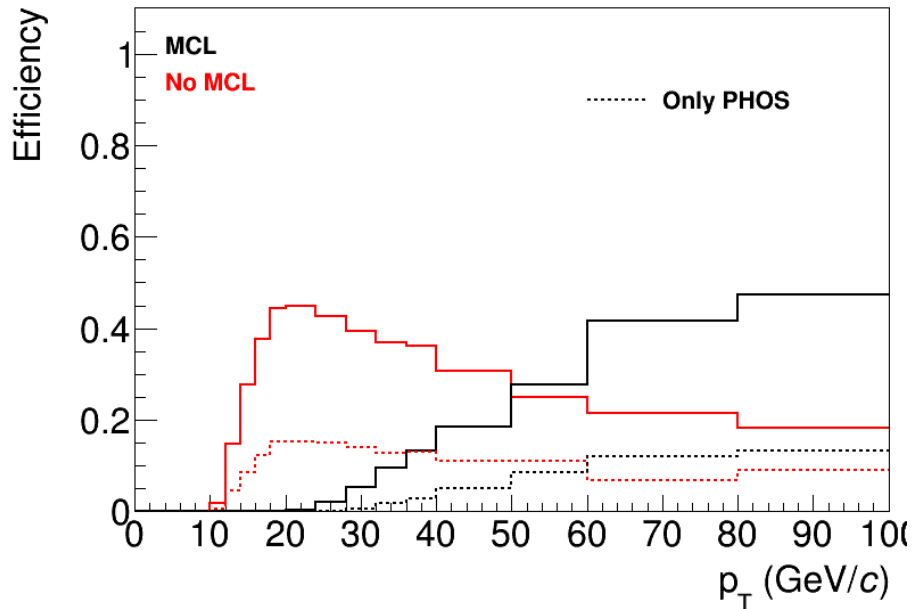

# Comparison of approaches (D<sup>0</sup>)

How many events needed to extract signal in each  $p_T$  bin with significance equal to 10 with two different approaches?

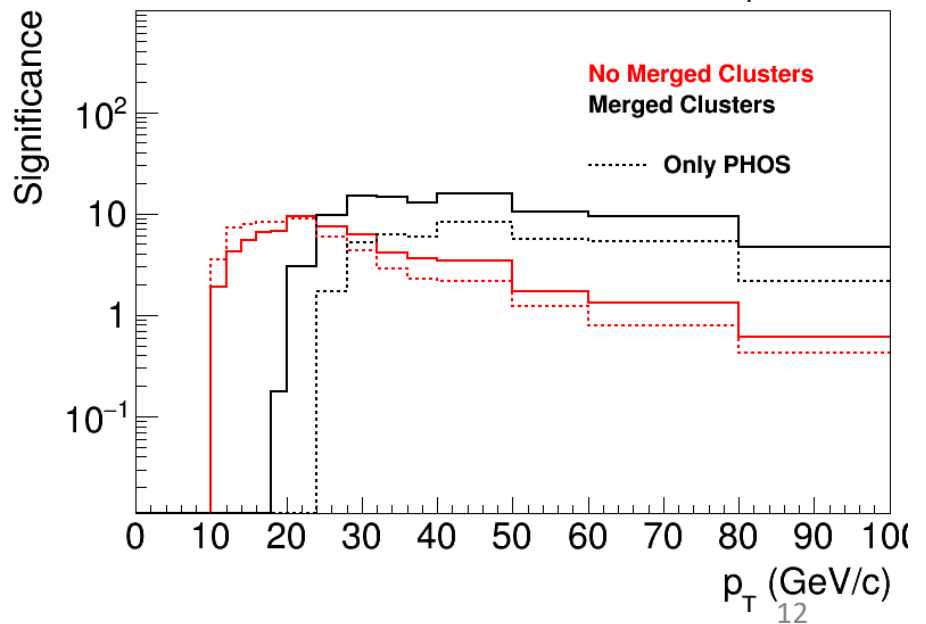

- No merged clusters approach is preferable at low  $p_T$
- Only merged clusters approach is preferable from  $\sim 30$  GeV/c and dominate at higher  $p_T$

# D(2010): Pb-Pb@5.5TeV

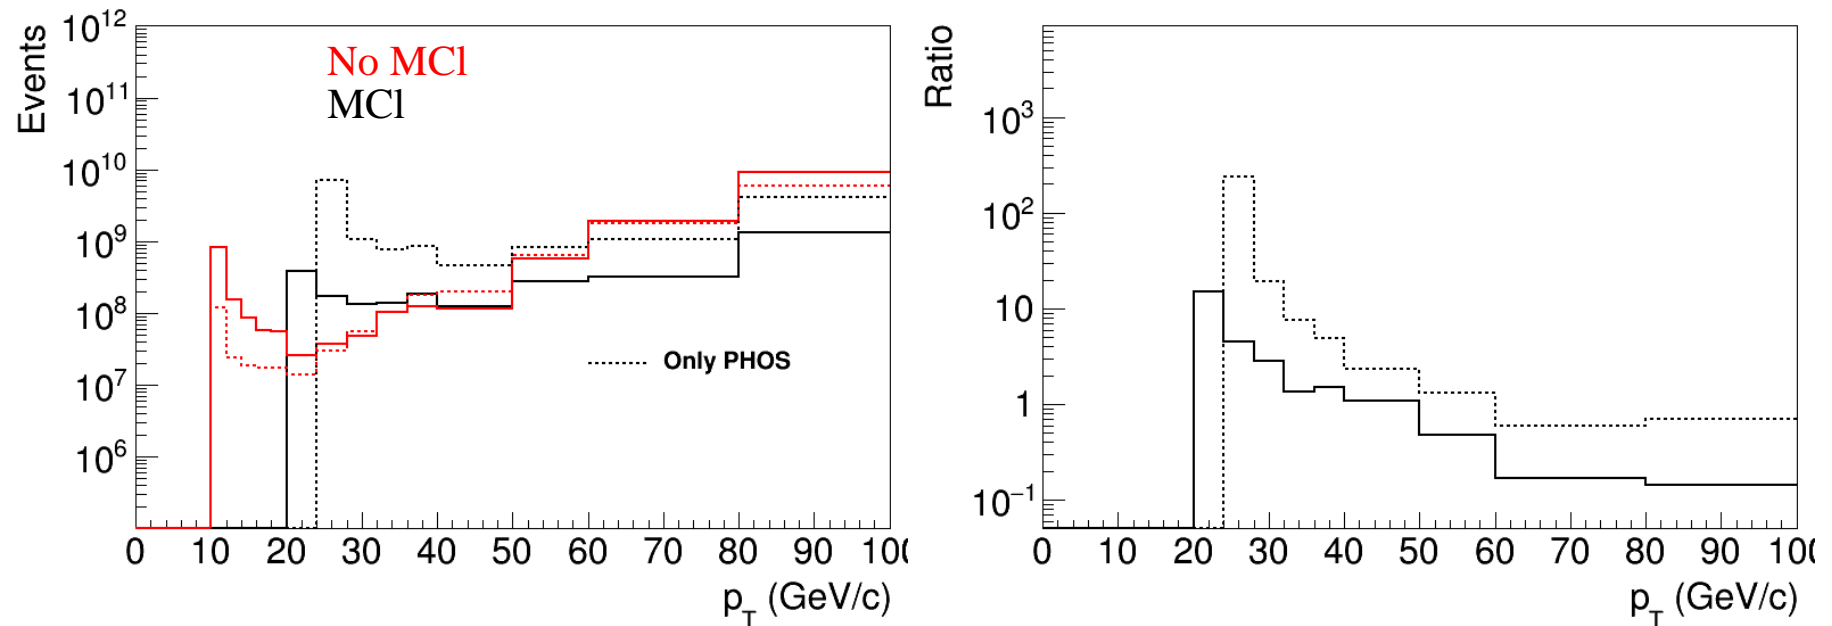

**SIGNAL** – If two gamma quants from  $\pi^0$  decay do not merge in one cluster such  $\pi^0$  is excluded from the analysis – lost signal

**BGR** – Signal from calorimeter is used as  $\pi^0$  (assumption that this signal consist of 2 gamma quants from the same neutral pion)

# D(2010): Pb-Pb@5.5TeV

How many events needed to extract signal in each  $p_T$  bin with significance equal to 10 with two different approaches?

- No merged clusters approach is preferable at low  $p_T$
- Only merged clusters approach is preferable from  $\sim 40$  GeV/c and dominate at higher  $p_T$

# Summary

- ❖ Measurement of heavy quarks will contribute to the ALICE3 physical program
- ❖  $D^0 \rightarrow \pi^\pm + K^\pm + \pi^0$  advantages in relatively large BR ( $\sim 14\%$ ) and electromagnetic calorimeter usage
- ❖ First estimations of detector resolution, reconstruction efficiency and cuts efficiency provided
- ❖ Principal possibility for  $D^0$ ,  $D(2007)$ ,  $D(2010)$  - mesons reconstruction in ALICE3 experimental setup demonstrated
- ❖ Merged clusters analysis is preferable for high  $p_T$  results
