

Analysis of $\phi(1020)$ production in the BM@N experiment

Ramin Barak

The 7th International Conference on Particle Physics and Astrophysics, Moscow, October 22-25, 2024

Introduction

- Collisions of heavy relativistic ions allow us to study nuclear matter at extreme density and temperature.
- At sufficiently high temperature and energy density, the so-called Quark-Gluon Plasma (QGP) is formed [1]:
 - Formation of strange particles.
- Theoretical models offer different descriptions [2],[3]:
 - New experimental data is needed for clarification.

Goal

 \bullet Observation of $\phi(1020)$ signal in the MC and experimental data.

Data

- Experimental data obtained in the physical session at the beginning of 2023 with a beam energy of 3.8 AGeV, a CsI target and Xe beam.
- Dubna Cascade Model Statistical Multifragmentation Model (DCM-SMM) and BOX Monte Carlo generators were used to model the data.
- About 0.8 million Monte Carlo and 22 million experimental events were analyzed.

Data processing procedure

- Reconstruction of particle tracks was carried out.
- Mathematical algorithms were developed and implemented to search for the $\phi(1020) \rightarrow K^+ + K^-$ decay:
 - shuffling pairs of particles with different signs
 - calculation of invariant mass
 - imposing a number of geometric restrictions on the parameters of each pair

PV – primary vertex.

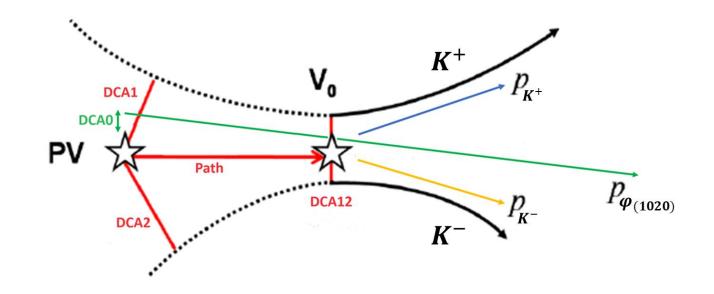

Path – the distance traveled by $\phi(1020)$ from the primary vertex to the point of its decay.

DCA0 – the distance between the primary vertex and the projection of momentum of $\phi(1020)$.

DCA1 – the shortest distance from K^+ to the vertex.

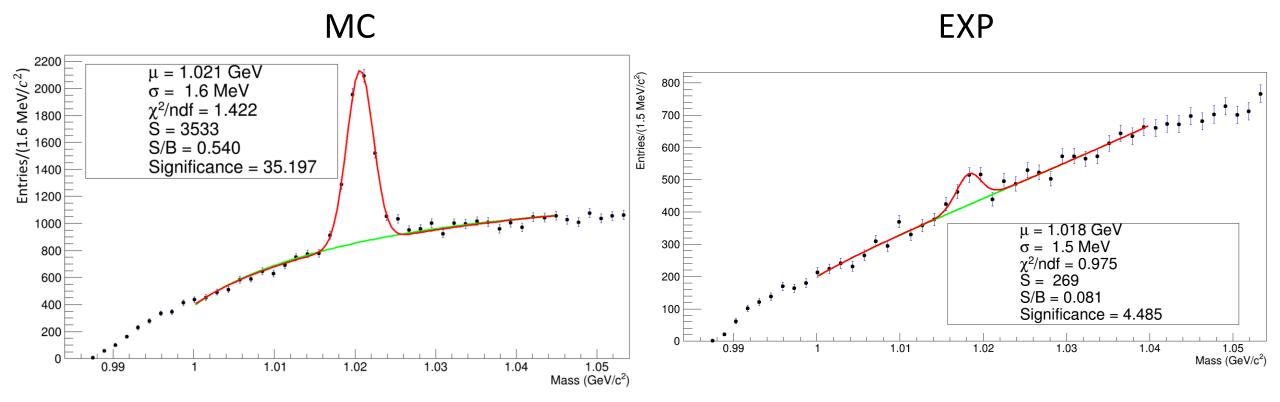

DCA2 – the shortest distance from K^- to the vertex.

DCA12 – the distance between K^+ and K^- at the decay point of $\phi(1020)$.

Event topology

Results

Efficiency = 0.44 %

Conclusion and future work

- $\phi(1020)$ signal was observed in both MC and experimental cases.
- Put more stringent constraints on certain cuts and more lenient ones on others.
- Increase the number of analyzed events in order to improve the results regarding experimental data.
- Derive more realistic values for kinematic parameters by means of other MC generators (UrQMD, PYTHIA).
- Compare MC results with experimental ones.
- Perform phase space analysis.
